INTRODUCTION

This collection of microfiche includes the documents announced in the Winter, 1967 issue of Abstracts of Research and Related Materials in Vocational and Technical Education (ARM). The microfiche set is arranged in the following sequence:

1. Vocational Technical (VT) Number Index to Microfiche Collection of Documents Reported in ARM, Winter 1967.

2. Selected indexes from ARM, Winter 1967.

   a. Author Index

   b. Vocational and Supporting Services Index

   c. Subject Index

   The page numbers shown in these indexes refer to the location of the abstracts in ARM, Winter 1967.

3. The full text of documents listed in the VT Number Index on pages 1-2.

   The documents are arranged in numerical order according to VT numbers. The texts of materials in this microfiche set have been filmed continuously in VT number sequence thereby facilitating the purchase of the texts of all documents on microfiche with one order. This filming method also lowers the cost of the entire set as contrasted to the purchase of individual titles on separate microfiche.

The documents identified in this collection of microfiche with an ERIC Document (ED) number are also available as separate documents from ERIC Document Reproduction Service (EDRS) by using the ED number. Items with the ED symbol but without the six numerical digits will be available as separate documents from EDRS when they have been fully processed into the ERIC system. Research in Education will announce those docvments as they become available from EDRS.

The documents identified in this collection of microfiche without an ED number are titles in the local clearinghouse collection. Microfiche for these items is obtainable only through purchase of this set or from agencies who have this set, and who have the capability of reproducing microfiche.

*OFF FARM AGRICULTURAL OCCUPATIONS, *EMPLOYMENT OPPORTUNITIES, *AGRICULTURAL SKILLS, COOPERATIVE EDUCATION, CURRICULUM DEVELOPMENT, *OCCUPATIONAL CLUSTERS, *EMPLOYER ATTITUDES, INDIVIDUAL CHARACTERISTICS, EDUCATIONAL NEEDS, EMPLOYMENT PRACTICES,

In order to determine preemployment educational needs of secondary school students entering nonprofessional off farm agricultural occupations, this study was designed to identify employing firms, existing occupations, desirable characteristics of beginning employers, employers' familiarity with vocational agriculture programs, employers' agreement on changes needed in the program, employers' willingness to cooperate in preemployment training, problems of conducting cooperative education programs, and employers' agreement on the relative importance of various instructional units. The sample of 474 firms was selected randomly from stratified population categories. An interview instrument was designed and pretested. It was administered by vocational agriculture teachers. Descriptive statistical techniques were used in analyzing data, and factor analysis was used to group competencies. Of 184 occupations, 125 were nonprofessional and most required on the job training. A rural background was preferred for beginning employees. Personality, ability to get along with others, and communicative ability were important factors in employee selection, as well as high school graduation. Agricultural competencies were needed, and post high school training would be required in some cases. Most employers felt occupational experience programs were necessary, and they would cooperate in spite of anticipated liability problems. (JM)

June, 1966

ACKNOWLEDGEMENTS

This study was a cooperative effort by the Department of Vocational, Technical and Practical Arts Education, Auburn University, Auburn, Alabama, and the Agricultural Education Service, Vocational Education Division of the Alabama State Department of Education, Montgomery, Alabama. The research coordinating committee consisted of D. P. Dilworth, Chairman; Dr. R. A. Baker, Co-chairman; H. W. Green, and T. H. Bell.

Grateful appreciation is given to each of the ninety-eight teachers of Vocational Agriculture who assisted the committee in collecting the data, and to the five hundred sixty-five persons in businesses, industries, and services for their time and the information given during interviews. The excellent co-operation of school administrators is also gratefully acknowledged.

Acknowledgements would not be complete without expression of appreciation to staff members of the Department of Agricultural Economics, Dr. L. O. Hite, School of Education, and the Computer Center of Auburn University for their assistance in the development of the study and analysis of data.

Practical Arts Education

INTRODUCTION

In the United States for each hundred students now enrolled in elementary schools three will probably not attain a secondary school diploma. Out of each hundred high school graduates, seventy will never apply for admission to colleges; eighty-six will live and work in our society without a baccalaureate degree.

Research conducted in 1964 by the Alabama State Department of Education revealed that of Alabama's secondary school graduates only thirty-one percent apply for college admission. Only fourteen percent of Alabama's high school graduates leave college with a baccalaureate degree.

Education may be viewed as having two basic components. One is of general nature, including knowledge and skills needed by all people. This is often referred to as general education. The other is occupational education which is concerned primarily with application of knowledge and skills to the world of work. Education for employment has been recognized as a legitimate function of the secondary school for several decades. Much has been said about this form of education in recent years. In fact, there appears to be a growing concern among secondary school educators that those youth who are not likely to go to college need some kind of specialized education which will prepare them for employment.

Purposes of the Study

The central problem of the study was to ascertain the pre-employment educational needs for secondary school students desiring to enter non-professional occupations in agriculture. The study involved the collection and analysis of data from individuals in businesses, industries and agencies of an off-farm agricultural nature.

The following research problems were investigated in the attempt to resolve the central problem of the study:

1. What are the agricultural businesses, industries and agencies in Alabama by main product or service categories in:

    a. farm machinery;
    b. farm supplies and equipment
    c. poultry and livestock industries;
    d. crop, forestry and conservation;
    e. ornamental horticulture, recreation, and wildlife; and
    f. farm services?

2. What are the occupations existing in the agricultural business categories of:

   a. farm machinery;
   b. farm supplies and equipment;
   c. poultry and livestock industry;
   d. crops, forestry, conservation;
   e. ornamental horticulture, recreation, wildlife; and
   f. farm service?

3. What are the desirable personal and background characteristics for entry level employment in off-farm agricultural businesses?

4. To what extent are business and industry managers, personnel directors, and supervisors familiar with the present secondary school program of vocational agriculture?

5. To what extent do business and industry owners, managers, personnel directors, and supervisors agree as to:

   a. the possibility of adjusting the present secondary school program of vocational agriculture to train for the off-farm agricultural occupations; and
   b. the possible curriculum approaches to pre-employment training for off-farm agricultural occupations in the secondary school program of vocational agriculture?

6. To what extent are off-farm agricultural firms and agencies willing to participate in a pre-employment educational program for off-farm agricultural occupations at the secondary school level?

7. What problems would be encountered by off-farm agricultural firms and agencies in participating in cooperative occupational experience programs for secondary school students?

8. To what extent do business and industry owners, managers, personnel directors, and supervisors agree as to the relative importance of selected basis instructional units in the pre-employment educational programs for occupations in agricultural firms and agencies?

Definition of Terms

The terms "off-farm agricultural business," "agricultural industry," and "agricultural agency," used in the study refer to those businesses, industries and agencies that provide supplies and services to individuals producing plants and animals. These plants and animals include those used for feed, food, fiber, shelter, and pleasure. The

primary factor considered in the classification of the off-farm agricultural firm was those businesses, industries and agencies that existed primarily for the purpose of providing supplies and services either directly or indirectly to individuals producing plants and animals.

The term "non-professional occupations" used in the study refers to occupations in which a majority of the respondents expressed that the educational requirement for entry employment is less than the baccalaureate degree level.[1]

The term "managerial level occupations" used in this study refers to occupations in which the respondents indicated as "manager."[2]

The term "occupational category" used in this study consists of a group of occupations or job titles within a business, industry or agency classified by the type of products sold and/or services provided.

The term "cluster" used in this study refers to a grouping by an association of common elements.

The term "sample counties" refers to the twenty counties selected at random from the counties in the state from which the sample of businesses and industries contacted were drawn.

The term "contact sample" refers to a random percentage sample of the total agricultural businesses, industries and agencies in the twenty sample counties.

The Data

Data for the study were obtained from 474 selected off-farm agricultural firms and agencies in the State, and the division heads of the State Department of Agriculture and Industries.

The sample of firms and agencies contacted in the study were selected at random from individual county listings of agricultural businesses, industries and agencies of the twenty sample counties. The sample counties were selected at random from a population stratification by vocational agriculture supervisory districts. The counties in each district were stratified into population units of less than 25,000; 25,000 to 50,000 and 50,000 and above. Two counties were selected at random from the less than 25,000 category and one county from the 25,000 to 50,000 category in each of the five supervisory districts. Jefferson, Etowah, Montgomery and Mobile counties were selected from the 50,000 and above category due to their metropolis area. One

---

[1]See Table 4, page 16 for listing.
[2]See Table 2, page 9 for occupations so indicated.

county in the central supervisory district was selected at random from the 50,000 and above category to make a total of twenty counties.

Procedure Used in Conducting the Study

The following procedure was followed in conducting the study:

1. Defined and clarified the terms off-farm agricultural business, industry or agency.

2. Tentatively categorized off-farm agricultural businesses, industries and agencies into seven broad categories.

3. Prepared a partial listing by categories of the off-farm agricultural businesses, industries and agencies.

4. Prepared a list indicating sources of listings of off-farm agricultural firms and agencies in Alabama.

5. Prepared forms to be used by teachers of vocational agriculture for the reporting of county agricultural firms and agencies.

6. Categorized counties in the state by population.

7. Selected at random from the population stratification, sixteen sample counties to be included in the study, excluding Jefferson, Etowah, Montgomery and Mobile.[3]

8. Held meetings in each supervisory district with the teachers of vocational agriculture in the selected counties to explain the mechanics of the study and the methods and procedures to follow in securing the listings of agricultural firms and agencies.

9. Designed and pre-tested the instrument to be used by teachers of vocational agriculture in interviewing owners, managers, personnel directors and/or supervisors of the firms and agencies.[4]

10. Selected an "nth" random contact percentage sample of the firms and agencies to be interviewed in each county from the county listings.

11. Held meetings in each supervisory district with teachers of

---

[3]See Appendix A, page 56
[4]See Appendix C, page 61

vocational agriculture to explain the mechanics and techniques to be used in conducting of interviews and assigning contacts to be made by each teacher.

12. Interviewed the selected contact sample in each of the sample counties.

Data Analysis

Descriptive statistical techniques were used in analyzing the data. Data with regards to the characteristics of workers and responses about programs were subjected to simple frequency tabulations.

Data relative to educational needs in terms of competencies were subjected to a factor analysis technique to identify the grouping (clustering) of competencies (instructional area) for occupational categories. Data used consisted of representative profile scores assigned to the verbal expressions of respondents as to the value of competencies for occupations. Since data were ordinal in nature, no statistical test interpretations were made with regard to correlations.

The data for the factor analysis were assembled by determining profile scores for each competency for each occupation and then for each competency for each occupational category.

PRESENTATION OF DATA

Agricultural Businesses, Industries and Agencies in Alabama. Table 1 reflects the types of agricultural businesses, industries and services operating in Alabama by main product or service categories. The eighteen types of firms or services listed are sub-divisions of the seven original broad categories included in the study classified according to the main products and/or services provided by the firms.

Occupations in Off-farm Agricultural Industries and Agencies. Table 2 reflects a total of 184 different occupation titles employed in the twenty counties within the firms in the contact sample. Of the total 184, one hundred twenty-five are classified as non-professional occupations by the definition used in this study.

Personal Characteristics Valued in Workers. A ranking of worker characteristics is revealed in Table 3. Respondents were asked to select the ten most valued traits wanted in their workers for a listing of twenty characteristics. Of the total 474 respondents, 465 indicated "works regularly and on time" as being one of the top ten most valued. Of course this is understandable because of the economic involvement. Characteristics relative to personal cleanliness and ability to get along with and communicate with people also were selected as being one of the ten most valued characteristics by 85 percent of the respondents.

Table 1. Agricultural Businesses, Industries, and Agencies in Alabama by Economic Activity

Main Product or Service Categories

Agricultural Chemical Manufacturers and Wholesales[1]

Dairy Products Manufacturers and Distributors

Crop Processing, Sales and Warehousing[2]

Farm Machinery and Equipment Manufacturers and Wholesales

Farm Machinery and Equipment Retail Sales and Service

Farm Service[3]

Farm Supply Retail Stores[4]

Feed Manufacturers and Wholesales

Flower Production and Sales

Food Processing and Distribution[5]

Government Agricultural Services[6]

Livestock Sales and Service[7]

Lumber and Wood Products[8]

Meat Processing and Wholesales[9]

Nursery Production, Sales and Landscaping Service

---

1 Fertilizers, herbicides, insecticides and gum and wood chemicals
2 Farm products (raw materials)
3 Does not include government agricultural services
4 Includes hardware stores in non-metropolitan areas
5 Includes canned and frozen food plants, flour mills, meat mills, and crop oil mills
6 Includes state and federal agencies
7 Includes stockyards and special services
8 Includes pulp mills, logging, pulp-wood contractor, sawmills, planning mills, and forest nurseries
9 Includes meat packing plants and freezer plants

Table 1 (continued)

Main Product or Service Categories

Ornamental Plant Service and Turf Care[10]

Pest Control Service

Poultry and Poultry Processing and Sales

---

[10]Includes parks, cemetaries, golf courses, country clubs and others.

Table 2. Occupations in Off-farm Agricultural Businesses, Industries and Agencies in Alabama by Economic Activity

Agricultural Chemical Manufacturers and Wholesales

1. General Manager
2. Plant Superintendent
3. Sales Manager
4. Agronomists
5. Technical Fieldman
6. Educational Director
7. Plant Supervisor
8. Fertilizer Salesman
9. Insecticide and Herbicide Salesman
10. Plant Office Clerk
11. Warehouse Stock Clerk
12. Millwright[1]
13. Warehouse Serviceman[2]

Dairy Products Manufacturers and Distributors

14. General Plant Manager
15. Dairy Plant Supervisor
16. Route Supervisor
17. Dairy Technologist
18. Dairy Plant Fieldman
19. Bulk Tank Truck Driver
20. Dairy Products Salesman
21. Dairy Plant Worker

Cotton Processing, Sales and Warehousing

22. Gin and Warehouse Manager
23. Cotton Fieldman
24. Cotton Buyer
25. Gin and Warehouse Bookkeeper
26. Gin Operator[3]
27. Ginwright[1]

Table 3. Ordinal Ranking of Employee Personal Characteristics as Valued by Four Hundred and Seventy-four Employers in Off-farm Agricultural Businesses and Industries in Alabama

Personal Characteristics	Number of Responses as Being One of Ten Most Valued
Works regularly and on time	465
Gets along with his fellow workers	463
Fulfills promises and obligations	462
Initiates undertakings	461
Completes his work	456
Speaks clearly and correctly	448
Makes wise use of time	445
Can express his ideas well	434
Is orderly in his work	433
Exhibits personal cleanliness and neatness	425
Uses good English in written form	415
Is honest in word and deed	413
Admits error when shown wrong	412
Possesses forceful personality	400
Seems happy in his work	398
Arouses enthusiasm in his fellow workers	370
Exhibits endurance in continued effort	325
Shows intellectual curiosity	315
Participates in civic activities	312
Places group above himself	310

Educational Requirement. The minimum educational grade levels for individuals desiring to enter occupations as expressed by the employing respondents are revealed in Table 4. It will be noted that a majority of the respondents indicated a minimum of high school education for all occupations with a few exceptions. In most cases these were semi-skill level occupations. Table 4 also depicts that managerial level positions are open to individuals with a high school education. It should be assumed however that age, experience, and the high school education are closely associated factors for entry into managerial occupations. The factors of age and experience may not be as closely associated with the employment of post-high school education graduates for managerial positions.

Post-High School Educations for Occupations. As reflected in Table 4, many of the respondents indicated that they do hire individuals with only a high school education. It will also be noted in Table 5 that technical short courses are not required for entry into many of the occupations. Table 5 also indicates that for those firms requiring technical training, such training is usually provided through on-the-job training by the firm or through some commercial concern. Very few firms utilize the public schools for employee training.

Table 4. Minimum Education Grade Levels for Individual Desiring to Enter Selected Occupations in Off-farm Agricultural Businesses and Industries as Expressed by the Employers Interviewed in Alabama

Headnote:
1. Will hire less than high school
2. High School
3. Post H.S. Technical
4. B. S. Degree
5. Master's Degree

Residential Background Preference. Table 6 reflects the residential background preferences of employers for persons entering occupations in agriculture. A vast majority of the respondents indicated that they preferred workers with a farm background; while a small percentage indicated no preference.

It will be noted that those few individuals indicating "no preference" did so primarily for managerial, sales, clerical and semi-skilled occupations in only a few of the main product and service categories. Respondents expressing the greatest percentage of "no preference" as contrasted to "farm background" by other economic activities, were lumber and wood products and meat processing and sales.

Familiarity of Instruction in Vocational Agriculture. As reflected in Table 7, of the 474 respondents contacted, 258 (54 percent) were either familiar or very familiar with the instructional program of vocational agriculture. Sixty-eight (14 percent) were somewhat familiar. The economic activities in which the number of respondents not familiar exceeded the number familiar with the program were: chemical manufacturers and wholesales; flower production and sales; food processing and distribution; ornamental plant service and turf care; and pest control service.

Table 6. Residential Background Preference for Individuals Entering Occupations as Expressed by the Employers Interviewed in Off-farm Agricultural Businesses and Industries in Alabama.

TOTALS.	126	138	68	142	474

Degree of Proficiency Vocational Agriculture could Prepare Workers. Table 8 reflects the opinions of the respondents as to the degree which vocational agriculture could prepare workers for agricultural firms. A majority of individuals expressed opinions varying from "very proficient" to "somewhat proficient." The opinions varied for occupations and for occupations within the main product and service categories. Expressions of lesser degrees of proficiency were expressed for skilled occupations.

Feasibility of Type of Instructional Programs. Table 9 reveals the feasibility ranking of four types of instruction programs for providing instruction for occupations in off-farm agricultural firms at the secondary school level. It is quite evident that the respondents believe the program of production agriculture and mechanics would not be the best approach. A vast majority agreed, as evident by their ranking, that the occupational clustering approach for related instruction and cooperative occupational experience program would be the most feasible approach. The responses were fairly well distributed with regard to operational approach for providing the instruction.

Table 8. Opinions of Employers Interviewed in Alabama As to the Degree of Proficiency the program of Vocational Agriculture could prepare workers for Occupations in Off-farm Agricultural Businesses and Industries.

Table 9. Expressions of the Employers Interviewed in Alabama as to the Most Feasible Type of Instructional Program for Providing at the High School Level the Pre-employment Needs for Occupations in Off-farm Agricultural Businesses and Industries.

Type of Program	Number of Persons Ranking Feasibility				
	1*	2	3	4	Total
Instruction in production agriculture, leadership and agricultural mechanics supplemented by on-farm production project program experiences	60	67	144	203	474
Instructional program consisting of skills and abilities common to both on-farm and off-farm agricultural occupations supplemented by leadership training and on-farm projects and/or work experience in businesses under the supervision of the business and teacher.	332	92	42	8	474
Instruction consisting of skills and abilities common to both on-farm and off-farm agricultural occupations the first part of the total instructional program followed by training in clusters of agricultural occupations supplemented by leadership training and on-farm production project and/or work experience in businesses under the supervision of the business and teacher.	368	60	32	14	474
Instructional program consisting of skills and abilities common to both on-farm and off-farm agricultural occupation supplemented by leadership training and on-farm projects and/or short exploratory work experience under the supervision of the business and teacher.	232	106	72	64	474

*Ordinal ranking with 1 begin most feasible.

Willingness of Firm to Cooperate with Schools. As reflected in Table 10, most of the firms were willing to cooperate and assist the schools in organizing and administering instructional programs. Only three percent of the 474 contacted indicated that their firm would not be willing to participate.

Anticipated Problems to be Encountered by Cooperating Firms. Although a majority of the firms were willing to cooperate and participate in work experience programs, some problems were anticipated. Sixty-six percent, as shown in Table 11, anticipated problems with liability insurance, while minimum wage law problems were anticipated by fourteen percent of the firms.

Clusters Based on Needed Competencies by Workers. In an effort to cluster occupational categories for program planning, the data collected were subjected to a factor analysis technique. Competency occupation scores were determined for each competency on the interview schedule for each occupation found in the contact sample. After determining the scores for each occupation, scores were determined for each competency for all occupations within each occupational category. These scores were used through a rotational correlation analysis to cluster the occupational categories and competencies. Table 12 reflects occupational categories clustered into five category factors. It is interesting to note that farm supply retail stores factored with four of the five category factors. Food processing and distribution, lumber and wood products, and farm service factored with agricultural machinery sales and service due to a large number of mechanical occupations in the three categories. Dairy products manufacturing and distribution

Table 10. Willingness of Businesses and Industries in Alabama to Participate in a Cooperative Instructional Program for Occupations in Off-farm Agricultural Businesses and Industries.

Degree of Willingness	Of Total (474) Interviewed	
	Number	Percent
Not willing	15	3
Permit students to visit and observe operations	425	90
Employ interested students during vacation periods	389	82
Employ interested students on a part-time basis during the school year	369	78
Employ interested students on a seasonal basis	432	91
Participate in a student work experience program a few hours during the school day on a non-pay basis	412	87
Participate in a student work experience program few hours during the school day on a non-pay basis and a pay basis on weekends	435	91
Work with school personnel in outlining an educational program which would help prepare persons for work in off-farm agricultural occupations	468	99
Release key employees to assist teachers in providing instruction for high school students	312	66

Table 12. Anticipated Problems to be Encountered as Expressed by Employees in Off-farm Agricultural Businesses and Industries in the Employing of Alabama High School Students in Work Experience Educational Programs.

Problem	Of Total (474) Interviewed	
	Number	Percent
Liability Insurance	312	66
Labor Union Regulations	14	3
Time Involved in Training Employees or Work Experience Programs	45	9
Minimum Wage Laws	66	14
Others	5	1

and ornamental plant services and turf care had relatively low rotated factors scores in Category Factor 3 and Category Factor 4.

Table 13 depicts the competencies clusters for all the non-professional and non-managerial level occupations found in the contact sample. The varimax analysis was programmed for sixteen factcrs. It will be noted in Table 13 that a majority of the competencies clustered into 10 "clean" competency factors with rotated scores of 50 and above. A majority of the rotated scores in factors 11 through 16 were in the 30's and below. Competencies with rotated scores of less than 40 were considered low correlations by the researcher and statistician.

Table 14 reflects competency clusters for occupations within the occupational categories clustered previously and reflected in Table 12. This analysis excludes managerial level occupations. The clustering pattern for the competencies, in general, was the same as for the analysis of all occupations as shown in Table 13. It will be noted however that many rotated competency scores were less than 40 for two or more of the category clusters in plant and soil science, animal and poultry science, crop production, ornamental horticulture and mechanical technology.

Table 12. Occupational Categories Clusters for Economic Activities in Off-farm Agricultural Based on Needed Competencies for Occupations within Businesses, Industries and Agencies in Alabama

Cluster	Rotated Factor Score

SUMMARY AND CONCLUSIONS

The central problem of this study was to ascertain the pre-employment educational needs for secondary school students desiring to enter non-professional occupations in business, industries and agencies of an off-farm agricultural nature.

The study involved the collection and analysis of data from 474 employers in seventeen different types of agricultural firms in twenty randomly selected counties in the state. The study was designed to investigate a number of questions relative to existing occupations and their characteristics. Data were collected by the interview technique with teachers of vocational agriculture serving as interviewers. Descriptive statistical techniques were used in analyzing the data with no attempt being made to make statistical test interpretation due to use of ordinal type data.

SUMMARY

1. Of the 184 occupations found in the twenty counties within the 474 payroll businesses, 125 were considered non-professional.

2. Personal characteristics relative to cleanliness and the ability to get along and communicate with other people were rated in the top ten most desirable characteristics of employees by 85 percent of the employers interviewed.

3. Semi-skilled occupations were the only occupations in which a majority of the employers indicated that they would hire non-secondary school graduates.

4. Most of the firms contacted indicated that they trained a majority of their employees through on-the-job training.

5. Thirty percent of the employers contacted were not familiar with the vocational agriculture program. A majority of these were located in the metropolis areas.

6. A rural background was preferred for most workers by a majority of the employers.

7. Employers indicated that a majority of the skilled occupations require a more concentrated form of education than can be completed at the secondary school level.

8. A majority of employers indicated that related instruction offered through an occupational cluster approach and concurrently with an occupational experience would probably be the best instructional approach.

9. A majority of the employers indicated a willingness to cooperate with schools in providing an instructional program.

10. Over half of the employers interviewed anticipated problems with liability insurance for student employees.

11. Using a correlation technique and derived competency scores for occupations in seventeen types of firms, the firms clustered into five occupational categories; namely: crop production supply sales and services; agricultural machinery sales and services; livestock and poultry sales, services and products processing; agricultural supply sales and services; and horticultural production, sales and services.

12. Using a correlation technique and derived competency scores for the 125 non-professional occupations in the firms, it was found that the occupational competency clusters areas for the group of 125 occupations were: plant and soil science; animal and poultry science; pest control; crop production; ornamental horticulture; farm business organization and management; general business; merchandising; basic mechanical technology and farm mechanization.

13. Using a correlation technique and derived competency scores for the occupational categories clusters, it was revealed that some competencies within the competency areas of plant and soil science; animal and poultry science; crop production; ornamental horticulture; and mechanical technology are not important for some occupations.

CONCLUSIONS

There are many employment opportunities in firms of an agricultural nature. The secondary school program of vocational agriculture must accept the responsibility of preparing or assisting in the preparation of individuals not only for production agriculture, but also for entry into the many occupations in the supporting services.

Conclusions drawn from the results of this study are:

1. Since a majority of the occupations found in the study were non-professional and some require on-the-job training, it appears that emphasis should be placed on the occupational competencies need for entry level employment.

2. A rural background is preferred but not a requirement for job entry. Emphasis was placed on education and occupational experience; therefore, students in urban and semi-rural areas interested in agriculturally related careers can benefit from instruction in vocational agriculture.
3. Personality is also considered an important factor in job success by employers in firms of an agricultural nature. The ability to get along with people and to communicate ideas are considered vital to a success in non-professional agriculturally related careers. Employers in agricultural businesses also want well educated people; therefore, high school drop-outs will receive little consideration when applying for a job in an agricultural type business if a high school graduate is available with the same level of competency and degree of experience.
4. Knowledge and skills in agriculture, business, and mechanics are needed by workers employed in businesses, industries and agencies of an off-farm agricultural nature. Many of the occupations require skills and knowledge usually taught beyond the secondary school level but less than baccalaureate level.
5. Secondary school students preparing for distributive occupations in agricultural firms should be placed in businesses to gain the needed occupational experiences for entry level employment.
6. Although employers in businesses, industries, and agencies of an agricultural nature anticipate problems, they are willing to assist schools in providing vocational education programs for secondary level students.

7. Instructional programs for occupations in agricultural businesses should include competency areas needed by a majority of the workers in the occupational clusters in which employment opportunities exist. Results of this study indicate that instructional (common elements) programs should include crop production, sales, and services; agricultural machinery sales and services; livestock and poultry sales, services and products processing; agricultural supply sales and services; and horticultural production sales, and services.

8. A core (common elements) instructional program for all agricultural occupations should be offered in schools where employment opportunities are limited or equally distributed among a number of the economic activities in the agri-business complex.

APPENDIX C

PRE-EMPLOYMENT EDUCATIONAL NEEDS FOR WORKERS ENGAGED IN OFF-FARM AGRICULTURAL OCCUPATIONS

(Interview Schedule)

County Number

I. Occupation

Job title _____

Level of employment code:

1. ( ) Semi-skilled
2. ( ) Skilled
3. ( ) Clerical
4. ( ) Sales
5. ( ) Supervisor
6. ( ) Manager
7. ( ) Service
8. ( ) Technical
9. ( ) Professional

Position of person interviewed:

1. ( ) Owner
2. ( ) Owner-Manager
3. ( ) Manager (hired)
4. (Personnel Director
5. ( ) Sales Manager
6. ( ) Office Manager
7. ( ) Others (specify) _____

Difficulty in filling vacancies with qualified persons

1. ( ) No difficulty
2. ( ) Some, but not much difficulty
3. ( ) Great difficulty
4. ( ) Extremely difficult

II. Checked below are the <u>ten</u> most valued personal characteristics of an employee (Check only ten)

( ) Orderly in his work
( ) Works regularly and on time
( ) Completes his work
( ) Makes wise use of time
( ) Shows intellectual curiosity
( ) Initiates undertakings'
( ) Fulfills promises and obligations
( ) Admits error when shown wrong
( ) Is honest in word and deed
( ) Seems happy in his work
( ) Participates in civic activities
( ) Places group above himself
( ) Arouses enthusiasm in his fellow workers
( ) Exhibits endurance in continued effort
( ) Gets along with his fellow workers
( ) Exhibits personal cleanliness and neatness
( ) Possesses forceful personality
( ) Can express his ideas well
( ) Speaks clearly and correctly
( ) Uses good English in written form

Educational grade level for entry (check one)

1. ( ) Will hire with less than high school
2. ( ) High school minimum
3. ( ) Post high school technical education
4. ( ) B. S. degree minimum
5. ( ) M. S. degree minimum
6. ( ) Doctor's degree minimum
7. ( ) Doesn't matter

Technical short courses required for entry

1. ( ) None required
2. ( ) Provided by firm being interviewed
3. ( ) Provided by commercial concern
4. ( ) Provided by public schools less than college grade
5. ( ) Provided by college (agricultural or others)

Residential background preference (check one)

1. (F) Farm background
2. ( ) Rural, non-farm background
3. ( ) Urban background
4. ( ) No preference

III. Pre-employment educational programs

To what degree of significance do you feel that the present instructional program of vocational agriculture trains a proficient worker in <u>this</u> occupation?

1. ( ) Very significant
2. ( ) Significant
3. ( ) Of some significance
4. ( ) Of little significance

Remarks_____

_____

To what extent of proficiency do you feel that a high school instructional program in vocational agriculture could train a worker for <u>this</u> occupation?

1. ( ) Very proficient
2. ( ) Proficient
3. ( ) Somewhat proficient
4. ( ) Very small degree of proficiency

Remarks_____

_____

Pre-employment Educational Program

To what extent are you familiar with the present Vocational Agriculture program?

1. ( ) Very familiar
2. ( ) Familiar
3. ( ) Somewhat familiar
4. ( ) Not familiar

Ranked in order are the ways in which the person interviewed felt would be most feasible in providing at the high school level the pre-employment educational needs for off-farm agricultural occupations.

A. ( ) Instruction in <u>production</u> agriculture, <u>leadership</u> and <u>farm mechanics</u> supplemented by on-farm production project program experiences.

B. ( ) Instructional program consisting of skills and abilities common to both on-farm and off-farm agricultural occupations supplemented by on-farm projects and/or work experience in businesses under the supervision of the business and teacher.

C. ( ) Instruction consisting of skills and abilities common to both on-farm and off-farm agricultural occupations the first part of the total instructional program followed by training in clusters of agricultural occupations supplemented by on-farm production project and/or work experience in businesses under the supervision of the business and teacher.

D. ( ) Instructional program consisting of skills and abilities common to both on-farm and off-farm agricultural occupation supplemented by on-farm projects and/or short exploratory work experience under the supervision of the business and teacher.

Company willingness to participate in a coordinated school-employer educational program for high school students: (Check all that apply.)

( ) Not willing
( ) Permit students to visit and observe operations
( ) Employ interested students during vacation periods
( ) Employ interested students on a part-time basis during the school year
( ) Employ interested students on a seasonal basis
( ) Participate in a student work experience program a few hours during the school day on a non-pay basis.
( ) Participate in a student work experience program a few hours during the school day on a non-pay basis and a pay basis on weekends.
( ) Work with school personnel in outlining an educational program which would help prepare persons for work in off-farm agricultural occupations.
( ) Release key employees to assist teachers in providing instruction for high school students.

( ) Others (specify)_____

Michigan,

Principals in 106 large high schools in Michigan were interviewed to determine how they would use an assistant who would be responsible for developing occupationally oriented programs for employment-bound youth. Duties, responsibities, and relationships which the assistant might be expected to assume or develop were also studied. The areas ranked in order of the principals' responses were -- (1) pupil personnel, (2) school-community relations, (3) instructional program, (4) business functions, and (5) teaching personnel. The first three of 27 activities listed and ranked by percentage of responses for major responsibilities of the assistant were -- (1) locating and organizing instructional materials, (2) determining local occupational education needs, and (3) operating a student job-placement program. It was concluded that most principals of large high schools in Michigan were interested in expanding vocational or occupational programs, and they saw the need for an assistant to give help and leadership. The assistant should be trained in both school administration and occupational education, and should work with the principal, other school personnel, and local civic, business, industrial and professional groups to improve the high school's ability to prepare young people for employment. FOREWORD

In 1963, The University of Michigan did a survey of principals of major high schools in Michigan to determine what kinds of assistance they would consider most helpful in developing and/or operating more adequate programs and services for employment-bound youth. Over 98 percent of the principals responded, and three-fourths of them favored spending "some" or "most" earmarked vocational education funds to help them improve their programs for employment-bound youth.

Most of the principals felt that they did not have time to give leadership to the programs for employment-bound youth, and nearly three-fourths of them felt their programs could be improved if funds were made available to provide an extra assistant to give this leadership.

The study reported here is an attempt to determine how high school principals would use an assistant responsible for the development of occupationally oriented programs and services.

Although the project director takes full responsibility for the study, it should be recognized that he has had the assistance of many of his colleagues. Particular credit should be given to Earl Shaffer, Assistant in Research for the project, for assisting in the design of the study and for carrying through most of the details. The services of William C. Eckerman of the Survey Research Center, were extremely valuable in constructing the interview guide.

I would also like to express my appreciation to the 120 principals (of the 123 contacted) who agreed to participate in the study by granting an interview. I would also like to thank the 40 men in the University of Michigan's first Leadership Development Project for Vocational and Technical Education who conducted the interviews.

Ralph C. Wenrich
Project Director

PART I. INTRODUCTION

A. STATEMENT OF THE PROBLEM

In the spring of 1963, a study was made by Wenrich and Ollenburger[1] to determine what kinds of assistance principals of larger high schools in Michigan would consider most helpful in developing and/or operating special programs and services for employment-bound youth. Of the 120 principals included in the study, 109 accepted the responsibility for giving employment-bound youth salable skills; only 19 principals felt that their schools were doing all that could be done toward achieving this goal. A majority of the principals felt that they did not have time to give leadership to the programs, and nearly three-fourths of them felt their programs could be improved if funds were available for an assistant who would administer the occupational education program.

To prepare people for such leadership positions, we need to know more about the nature of these positions and the duties and responsibilities involved.

B. OBJECTIVES OF THE STUDY

The objectives of the study were:

1. To determine what duties and responsibilities the principals would give to an assistant responsible for leading the development of occupationally oriented programs and services.

2. To determine the relationship the assistant has and/or should have with the principal, counselors, teachers, individuals in other community agencies and organizations, and in the world of work.

3. To determine if there is a pattern of duties, responsibilities, and relationships which the assistant might be expected to assume and develop.

C. SCOPE OF THE STUDY

The study included 106 of 123 Michigan high school principals of schools with a student population of 700 or more in grades 10-12, of 1000 or more in

---

[1] Ralph C. Wenrich and Alvin Ollenburger. High School Principals' Perceptions of Assistance Needed in Order to Develop More Adequate Programs for Employment-Bound Youth. Ann Arbor: The University of Michigan Office of Research Administration, December 1963.

grades 9-12, and of 1,600 or more in grades 7-12. This was the same group of principals who were involved in the earlier study by Wenrich and Ollenburger.

D. PROCEDURE

A list was made of the types of duties and responsibilities related to occupational education with which high school principals needed assistance. This was done with the help of principals, professors of secondary school administration and curriculum, and twenty occupational educators from Michigan, who were members of the University of Michigan's first summer workshop of the Leadership Development Project for Vocational and Technical Education, held during the 1964 summer session.

An interviewer's questionnaire guide was constructed and pre-tested by giving it to a number of staff members and high school principals who were not included in the population to be interviewed. The questionnaire was then revised to eliminate ambiguities (See Appendix, p. 20).

As a voluntary assignment during their training internship, the twenty members of the Leadership Development Project Workshop and twenty members of the control group for the project were assigned certain high school principals to visit and interview, using the questionnaire guide.

Early in January, a letter was sent to each of the 123 principals whose schools qualified for the study, explaining the purposes of the study and requesting their participation in the interviews (see Appendix, p. 19).

Interviews were completed with 106 of the 123 principals. Only three principals declined the invitation to take part in the interview. Because of time limitations and changes in positions, the interviewers were unable to complete 14 interviews.

PART II. RESULTS OF THE STUDY

A. FIVE AREAS OF RESPONSIBILITY FOR PROPOSED ASSISTANTS

For this study the projected duties and responsibilities in which an assistant might be involved were divided into five major areas:

Instructional Program
School-Community Relations
Pupil Personnel
Teaching Personnel
Business Functions

Under each of the major areas were a number of specific areas of activity, designated by the letters a, b, c, etc. (see questionnaire, Appendix, p. 21).

The principals were asked to indicate to what extent they felt the proposed assistant should be involved in and have responsibility for the activities listed under each of the five areas.

The choices for responding to each item were that the new assistant principal would:

1. Have primary responsibility for the area, subject only to the veto power of the principal

2. Share responsibility for the area with the principal

3. Act only as an advisor to the principal in this area

4. Not be involved at all in this area

To save space, the responses have been shortened, in the rest of this study, to PRIMARY RESPONSIBILITY, SHARED RESPONSIBILITY, ADVISORY ONLY, NO RESPONSIBILITY.

1. Comparing the Responses for the Five Areas of Responsibility

The activities under Pupil Personnel received the highest average number of votes per item (64 percent) as an area of PRIMARY RESPONSIBILITY for the assistant. School-Community Relations ranked second, with an average of 60 percent of the responses under PRIMARY RESPONSIBILITY. Instructional Program ranked third, with an average of 47 percent, and Business Functions ranked fourth with an average of 43 percent. The fifth ranked area was Teaching Personnel, with 16 percent (see Table I).

TABLE I

THE FIVE MAJOR AREAS RATED AS MAJOR RESPONSIBILITY OF THE NEW ASSISTANT (RANKED ACCORDING TO AVERAGE PERCENTAGE OF PRINCIPALS' RESPONSE)

Area by Rank	Area by Title	Average Percentage
Area One	Pupil Personnel	64
Area Two	School-Community Relations	60
Area Three	Instructional Program	47
Area Four	Business Functions	43
Area Five	Teaching Personnel	16

When the major areas of responsibility are ranked according to the average percentage of responses per item indicated as a SHARED RESPONSIBILITY, Instructional Program and Teaching Personnel both received an average of 41 percent, Business Functions was third with 33 percent, School-Community Relations was fourth with 32 percent, and Pupil Personnel was fifth with 19 percent (see Table II).

2. Comparing the Responses for Specific Activities Listed Under the Major Areas of Responsibility

More than 50 percent of the principals felt that each activity under Pupil Personnel was a PRIMARY RESPONSIBILITY of the new assistant. First and second in this group were operation of a student job-placement program and establishment of a student job-placement program, with 75 and 74 percent of the votes, respectively (see Table III).

Under School-Community Relations, at least 50 percent of the principals felt each activity to be a PRIMARY RESPONSIBILITY of the new assistant. Determining local occupational needs through recognized methods such as surveys ranked first, with 76 percent. Establishing and/or working with lay advisory committees and developing relations with community agencies and professional organizations ranked second, with 70 percent (see Table IV).

Only one activity under Instructional Program, initiating curriculum innovation, was viewed by at least 50 percent of the principals to be a PRIMARY RESPONSIBILITY of the new assistant. Although Instructional Program ranks third in terms of the principals' perceptions of PRIMARY RESPONSIBILITY, 3 of the 5 activities listed under that area were seen by at least 50 percent of the principals as a SHARED RESPONSIBILITY for the new assistant (see Table V).

No single activity listed under Business Functions received a 50 percent vote under any of the four possible response categories. Item c, purchasing supplies and equipment, was felt by 49 percent of the principals to be a PRIMARY RESPONSIBILITY, while 48 percent saw activity a, budget planning, as a PRIMARY RESPONSIBILITY of the new assistant (see Table VI).

None of the activities having to do with Teaching Personnel was felt to be a PRIMARY RESPONSIBILITY of the new assistant. Fifty-nine percent of the principals rated orienting new teachers as a SHARED RESPONSIBILITY. A noticeable majority, 71 percent, felt that the new assistant would not be involved in determining salaries for teachers (see Table VII). In space provided for further comment, many principals pointed out that salary was not within the realm of building administrative staff.

In the areas of Instructional Program and Teaching Personnel, most of the activities were felt to be more a SHARED RESPONSIBILITY than a PRIMARY RESPONSIBILITY of the new assistant. However, none of the principals classified any of the activities under Instructional Program as NO RESPONSIBILITY (see Table V).

TABLE II

THE FIVE MAJOR AREAS RATED AS SHARED RESPONSIBILITY OF THE NEW ASSISTANT (RANKED ACCORDING TO AVERAGE PERCENTAGE OF PRINCIPALS' RESPONSES)

Area by Rank	Area by Title	Average Percentage
Area One	Instructional Program	41
Area One	Teaching Personnel	41
Area Three	Business Functions	33
Area Four	School-Community Relations	32
Area Five	Pupil Personnel	19

Answer	Activities Under Teaching Personnel*						
	a	b	c	d	e	f	g
Major Responsibility	13	4	10	35	42	0	9
Shared Responsibility	49	37	43	59	49	12	45
Advisory Only	26	36	30	1	7	17	39
No Responsibility	12	22	16	3	0	71	5
No Response	0	1	1	2	2	0	2
Total	100	100	100	100	100	100	100

*a. Recruiting of teachers in the occupational education area

b. Making final selection of teachers

c. Assigning teachers to departments

d. Orienting new teachers

e. Providing in-service education for teachers

f. Determining salaries for teachers

g. Recommending teachers for promotion

No activity was rated ADVISORY ONLY by more than a few principals.

When all activities in the questionnaire were ranked according to the percentage of principals listing them as PRIMARY RESPONSIBILITY, the first ten were from three major areas: School-Community Relations, Pupil Personnel and Instructional Program (see Table VIII).

B. FURTHER COMMENTS BY PRINCIPALS PARTICIPATING IN THE STUDY

The principals were encouraged to comment about or qualify any of their responses or to mention any activities which they felt should have been included in the questionnaire. Many of the principals pointed out that the distinction between a PRIMARY RESPONSIBILITY and a SHARED RESPONSIBILITY was not as easily defined as the questionnaire would imply. They felt that the assistant should offer strong leadership, but that major decisions in any of the five areas mentioned should reflect the combined efforts of the chief administrator, the assistant, and any others responsible for the administration of the total high school program.

Only five principals indicated that they saw no need for an assistant to handle the duties outlined in the study. Three of the five felt that they did need assistance in most of the areas outlined but preferred to get it from a director or coordinator of vocational education.

Sixty-five of the 106 principals stated that their schools had a vocational or occupational track. However, of the other 41, ten listed courses which they considered vocational or occupational, indicating that although they do not use the tracking system, they do have occupational educational offerings.

In further discussion with the interviewers, most principals stated that they do recognize the need for expansion of their present occupational offerings. In many schools, the occupational programs are being expanded and the principals indicated satisfaction with the results of those courses which they felt were in fact occupational education.

The principals felt that an assistant for occupational education, in order to fill adequately the role proposed for him, would have to be well trained in school administration and have a thorough knowledge of the needs and methods of training young people adequately for the world of work.

If trained persons were available, many principals felt that the greatest problem would then be that of locating additional funds for their salaries. If funds were made available, the principals indicated that both they and their boards of education would look favorably on the concept of a new assistant to give leadership to the development of better occupational training programs.

TABLE VIII

RANKING ORDER OF ALL ITEMS ON THE QUESTIONNAIRE, BY PERCENTAGE OF RESPONSES UNDER MAJOR RESPONSIBILITY

Rank	Activity	Percentage
1	Locating and organizing instructional materials	81

26	Making final selection of teachers	4
27	Determining salaries for teachers	0

C. RELATED INFORMATION

Of interest to the interviewers, though not an essential part of the questionnaire, was the relationship of the principals' educational history and administrative experience to their responses. Though no direct correlation was found, the results are included here since they may be helpful as background information.

When asked to list their undergraduate and graduate majors, the principals mentioned twenty-five fields. Only 19 principals listed the same undergraduate major (history). General social studies ranked second with 17 mentions and mathematics was third with 15.

However, nearly half of the principals (51 of the 106) listed secondary school administration as their graduate major. General secondary education ranked second with 19 mentions.

When questioned about their background of administrative experience, 59 of the 106 principals reported 1-10 years of teaching experience before their first administrative experience. Only 19 of the 106 principals had taught 10-15 years before becoming a principal. Forty-seven of the principals had 1-5 years of experience as assistants or part-time principals before first being employed as full-time principals and 16 principals held assistant or part-time positions for 5-10 years.

Sixty-four of the 106 participants have occupied positions as full-time principals for ten years or less. Fifty-six principals have held their present positions for five years or less, 17 for 5-10 years, and 17 for 10-15 years.

Opinions of the interviewers compared favorably with those of the principals as to the extent to which the schools were meeting the occupational education needs of their students. There were, however, some notable exceptions. In 21 instances, the interviewer indicated that programs which the principal considered occupational or vocational were actually good general classes in industrial arts and did not have adequate depth to prepare students for employment.

Generally, interviewers felt that high schools were doing a realistic job with those courses designed with the objective of salable skills, but that most schools offered too few.

The interviewers felt that they were well received by the principals participating in the study. They rated 92 of the principals as interested or very interested and only 11 as neutral or uninterested. Three interviewers made no response.

D. CONCLUSIONS

A majority of the larger high schools in Michigan are offering some form of vocational or occupational program. Most of the principals of these schools are interested in expanding these programs, and they see the need for an assistant to give help and leadership.

Although the principals give top priority to the areas of Pupil Personnel, School-Community Relations and Instructional Program, they want an assistant to administer the program in occupational education.

Principals perceive the assistant as a person trained in both school administration and occupational education, who can work with the principal, other school personnel, and local civic, business, industrial, and professional groups to improve the high school's ability to prepare young people for employment.

E. RECOMMENDATIONS

It is recommended that the State Board of Control for Vocational Education:

1. Adopt reimbursement policies which will encourage boards of education to provide principals of high schools large enough to operate specialized vocational programs with an assistant (full or part-time) whose responsibility it would be to give leadership to the development of better programs for employment-bound youth.

2. Encourage graduate schools of education to include more courses designed to acquaint high school administrators with the current nature and needs of occupational education.

3. Encourage graduate schools of education offering work in vocational education and vocational administration to provide more training and experience in activities having to do with pupil personnel and school-community relations.

4. Provide special consultant services to high schools wishing to establish a pupil placement program.

5. Adopt reimbursement policies which will encourage high school administrators and their faculties to spend more time in activities such as program planning and development of materials.

6. Encourage visitation programs between administrators and faculty members of high schools to exchange ideas and experiences in occupational education.

7. Encourage principals to seek out potential leaders in occupational

programs among members of their faculties and to assist these persons in acquiring the training and experience they need to qualify for these positions.

THE UNIVERSITY OF MICHIGAN
SCHOOL OF EDUCATION
ANN ARBOR, MICHIGAN 48104

DEPARTMENT OF VOCATIONAL EDUCATION
AND PRACTICAL ARTS

MEMORANDUM

DATE: January 12, 1965

TO: Selected High School Principals in Michigan

FROM: Ralph C. Wenrich, Chairman
Department of Vocational Education and Practical Arts

SUBJECT: Request for an Interview

In the spring of 1963 The University of Michigan conducted a study to determine the kinds of assistance high school principals would consider to be most helpful in developing and operating special programs and services for employment-bound youth. A report on the study titled "High School Principals' Perceptions of Assistance Needed in Order to Develop More Adequate Programs for Employment-Bound Youth," was sent to you about a year ago.

In this study the majority of the high school principals who responded indicated that they do not have time to give leadership to the development and operation of more effective programs for employment-bound youth. Nearly three-fourths of the respondents indicated that programs for employment-bound youth in their schools could be improved if they had "an extra assistant whose job it would be to give leadership to the program."

We are currently engaged in a study designed to determine how high school principals would use an assistant whose responsibility it would be to develop occupationally oriented programs for employment-bound youth. As a part of this study, arrangements have been made for persons currently engaged in the University of Michigan Leadership Development Project to interview high school principals included in the study. You will therefore receive a call from one of these men requesting that he be granted an interview with you. This interview should require no more than 20 to 30 minutes. It is hoped that you will find it possible to cooperate with us in this study by granting the interview, and possibly by allowing the interviewer to visit the areas in your building in which programs for employment-bound students are now being offered.

AN ASSISTANT PRINCIPAL FOR OCCUPATIONAL EDUCATION

DUTIES AND RESPONSIBILITIES

(Questionnaire Guide)

Interviewer:_____

Principal:_____

Date of Interview:_____

Many of those currently concerned with the problem of meeting the need for realistic occupational education in the high school are suggesting that principals of larger high schools should have an assistant in charge of occupational education. It is assumed that his primary function would be that of developing, and giving assistance in the administration of, the occupational education portions of the school's instructional program.

The primary purpose of this questionnaire is to assist in determining the types of duties and responsibilities for which such assistants should be prepared.

Should a need be established for such an assistant in your school, the new position may include a number of responsibilities. In his role of developing and helping to administer the occupational education program for your school, to what extent do you feel the assistant principal would be involved in and have responsiblity for each of the following areas:

	The New Assistant Principal Would:			
	Have primary responsibility for this area subject only to veto power of principal	Share responsibility for this area with the principal	Act only as an advisor to the principal in this area	Not be involved at all in this area
INSTRUCTIONAL PROGRAM				
a. Identifying and agreeing upon objectives	___	___	___	___
b. Evaluating existing programs	___	___	___	___
c. Developing and revising the curriculum	___	___	___	___
d. Initiating curriculum innovation	___	___	___	___
e. Improving instructional procedures	___	___	___	___
f. Locating and organizing instructional materials	___	___	___	___
SCHOOL-COMMUNITY RELATIONS				
a. Involving local business and industry in the problems and programs of the school	___	___	___	___
b. Establishing and/or working with lay advisory committees	___	___	___	___

SCHOOL-COMMUNITY RELATIONS (Continued)

c. Determining local occupational education needs through recognized methods, such as community surveys	___	___	___	___
d. Developing relations with such community agencies as M.E.S.C., chambers of commerce, law enforcement agencies, representatives of labor and management, and other professional organizations	___	___	___	___
e. Interpreting the school's occupational education program to parents and patrons of the school	___	___	___	___
f. Interpreting, for the school and the community, legislation affecting occupational education	___	___	___	___
PUPIL PERSONNEL				
a. Offering vocational guidance services to students	___	___	___	___
b. Selecting students for occupational training	___	___	___	___
c. Establishing a student job placement program	___	___	___	___
d. Operating a student job place program	___	___	___	___
e. Conducting follow-up studies of students after graduating from--or dropping out of-- high school	___	___	___	___
TEACHING PERSONNEL (Teachers whose courses affect occupational education)

Ohio,

A survey of persons seeking employment through every public employment office in Ohio was designed to update and compare findings with results of a similar study conducted in 1962. Total jobseekers registered for employment in 1965 numbered 132,350. In 1962, the total was 215,477. The decline of 39 percent was due in part to the shorter validity period (time within which applicants must revisit the local office to indicate continued availability) for the 1965 count in 22 local offices. More important, however, were generally improved employment opportunities. Nearly 62 percent of the jobseekers were not high school graduates in 1962, compared with 60 percent in 1965. Among the youth under 20, the proportion who had not finished high school rose from 49 to 54 percent between the two counts. Jobseekers under 20 totaled 14,394 in 1962 and 16,971 in 1965, representing an 18 percent increase. This was the only age group whose total did not show a substantial decline between the two counts. Of the total registered, one out of four had no formal education beyond the eighth grade, three out of five had no high school diploma, one-third had finished high school but did not go on to college, and fewer than one out of twelve had some college training. The appendix includes tables of data for each county in Ohio with the educational attainment of registered jobseekers by occupational and age group in 1962 and 1965. (PS)

ACKNOWLEDGEMENTS

Employability of jobseekers, of course, varies with many factors beyond the state of the economy. Among the more important of these factors are level of educational attainment, skill, age, and sex. This study, emphasizing formal educational attainment, was designed not only to update comparable tabulations three years earlier, but also to provide--for the first time--data for each county of Ohio.

The research design and analysis were undertaken by William Papier, Director of Research and Statistics, who supervised the study. James W. Drake, Assistant Director for Statistics, edited the local returns and prepared the summary tabulations, assisted by Gerry Ziegler, Statistician.

Especial acknowledgement is due Millard E. Draudt, Director of Local Office Operations, and his local employment office managers throughout Ohio, who were responsible for the substantial task of reviewing and tallying the basic registration records.

Willard P. Dudley, Administrator
Ohio Bureau of Unemployment Compensation

September 1965

EDUCATIONAL ATTAINMENT OF JOBSEEKERS REGISTERED FOR EMPLOYMENT WITH THE OHIO STATE EMPLOYMENT SERVICE, APRIL 25, 1965

INTRODUCTION

The Ohio Bureau of Unemployment Compensation administers the statewide network of public employment offices known as the Ohio State Employment Service. Although these offices serve all of Ohio's 88 counties, there were a total of 80 full-time offices in the State, located in 55 counties, as of April 25, 1965.[1]

Persons seeking employment in Ohio, whether or not covered under the Ohio Unemployment Compensation Law may register with the Service and be considered for job openings. No charges, beyond regular tax costs, are levied on applicants or employers.

Persons already employed, but who are seeking other or better jobs, may also register. Although no count is made of those employed at the time of registration, it is estimated that at least 95 percent are jobless.

Candidates for employment in Ohio are free to register with any public employment office in the State. Most, more than likely, register with the office nearest their home, which is frequently in the county of residence. Some, who prefer employment in large metropolitan centers or elsewhere, doubtless cross one or more county lines to register. Data by county, therefore--presented for the first time in this study--relate to county of employment preference, except for counties

---

[1] See Appendix for map showing location of full-time offices and counties served.

which have no full-time offices. For counties where no full-time offices are located, data on jobseekers were tallied according to home county. The great preponderance of jobseekers probably prefer jobs within commuting distance of home.

This study was designed to update and compare findings with results of a similar study conducted three years earlier, the supply of which was exhausted shortly after publication. As in the case of the prior survey, a complete count was made of persons registered with every public employment office in Ohio, as of April 25. This date was chosen in both cases to exclude, insofar as possible, large numbers of temporarily unemployed construction workers (during winter months) and students seeking vacation jobs (during summer months).

The number of active jobseekers is affected, both in volume and composition, not only by seasonal factors and the general level of the economy, but also by the length of time registrations are considered active, the extent to which jobseekers voluntarily solicit the aid of public employment offices, and other factors.

Registrations are maintained as active for a prescribed validity period--the time within which applicants must revisit the local office to indicate continued availability for employment. At the time of the earlier study 22 local offices had validity periods of 60 to 89 days. The remaining 42 offices kept their applications active from 30 to 59 days. At the time of the current study, however, all local offices were clearing their files on 30 to 59 day validity periods.

Registered jobseekers represent a very large segment but by no means all of the unemployed. Most claimants for unemployment compensation are included. Among those usually excluded, however, are

claimants laid off temporarily with expectations of early recall, and partially-employed claimants on reduced hours. Those who have been disqualified for benefits, or who have exhausted their benefit rights, may register voluntarily, but are not required to do so.

Persons who are not covered under the Ohio Unemployment Compensation Law may or may not be registered. Of these, some may seek other channels of employment--through direct application to employers, union hiring halls, advertisements, family and friends, professional associations, schools, colleges, non-profit, or private employment agencies. Some of the unemployed--because of age, health, or other reasons--may not maintain active registrations on a continuing basis, possibly because of limited needs or job prospects, or both.

Other factors also influence the volume and composition of registered jobseekers. These include the effectiveness of local offices as placement agencies, the extent to which local employers maintain self-sufficient personnel departments, and the nature, extent, and effectiveness of competing agencies and media.

Levels of formal educational attainment, as reported by jobseekers, were cross-classified in both studies by sex, occupational group, and age group. Application records were tallied to record the formal schooling of each jobseeker in one of five possible groups: (1) eight or fewer grades; (2) some high school; (3) high school graduate; (4) some college; or (5) college graduate.

Following the standard classification system used by all public offices in the nation, each jobseeker was further tallied by skill, in one of seven broad occupational groups: (1) professional, technical, and managerial; (2) clerical and sales; (3) service; (4) skilled;

(5) semiskilled; (6) unskilled (including agricultural); and (7) entry. Entry classifications apply to persons who must be considered for jobs on bases other than prior work experience or fully-qualifying training. Many new entrants to the labor force are so-classified. Older workers may also be tallied in entry occupations, when re-employment prospects in prior occupations are poor because of skill obsolescence or deterioration, or physical handicaps.

Younger jobseekers were broken into two age subgroups--those under 20 and those from 20 through 24 years of age. Those 25 and over, however, were tallied in ten-year intervals, up to the oldest group who were 65 years of age or over.

Detailed tabulations for the State of Ohio and for individual counties are presented in the Appendix. Preceding these, however, are two maps, the first of which shows the location of local offices as of April 25, 1965 and the counties served by each. The second map identifies the eight most populous counties of Ohio, indicating areas served by local offices in these counties, and also identifying counties embraced in tabulations of registrants in Southeastern Ohio.

Tables in the A series in the Appendix are all summary tables, offering statewide data or comparative data for groups of counties. Tables in the B series are individual county tables, presented in alphabetic sequence.

In interpreting the data tabulated it should be kept in mind that the active file of the Ohio State Employment Service should not be considered necessarily representative either of the labor force or of the unemployed segment of the labor force. They do reflect, however, some of the major qualifications for employment of a very large segment of the unemployed jobseekers in Ohio.

STATEWIDE ANALYSIS

Total jobseekers registered for employment with the Ohio State Employment Service on April 25, 1965 numbered 132,350. Of these, two out of three were men. Three years earlier the total was 215,477. Nearly seven out of ten were men.

The decline of 39 percent in the total number of jobseekers, as well as the shrinkage in the proportion of men, was due in part to the shorter validity period for the latest count for 22 local offices. Probably far more important, however, were generally improved employment opportunities. As of April 1962, for example, Ohio's overall rate of unemployment was estimated at 5.2 percent of the civilian labor force. By April 1965 this had dropped to 2.7 percent.

Over the three-year period moderate improvement occurred in the level of formal educational attainment of Ohio's registered jobseekers. Whereas nearly 62 percent were not high school graduates at the time of the earlier count, only 60 percent were so-classified by April 25, 1965. The improvement, however, was concentrated largely among women jobseekers, since, as indicated by the percentages below, 65 percent of the men in both counts had not finished high school:

Educational Attainment	Total		Men	
	1962	1965	1962	1965
Total[1]	100.0	100.0	100.0	100.0
Eight grades or fewer	29.6	25.8	33.8	30.6
Some high school	32.2	34.3	31.7	34.7
High school graduate	30.8	31.9	26.6	26.3
Some college	6.1	6.7	6.3	6.8
College graduate	1.3	1.4	1.6	1.7

[1]Totals may not add precisely to 100.0 percent in this and following tables because of rounding to one decimal place.

The proportion of men with high school diplomas (but no college training) shrank slightly. This probably reflects somewhat greater employer demands for male high school graduates, as job prospects generally improved between April 1962 and April 1965.

As might be expected, jobseekers with lower levels of skills also had lower levels of formal education. The table below shows the percentages of jobseekers by occupational group who did not graduate from high school:

Occupational Group	Total		Men	
	1962	1965	1962	1965
Total	61.8	60.1	65.5	65.3
Professional and managerial	19.1	16.0	17.6	14.8
Clerical and sales	28.8	24.2	29.9	26.5
Service	74.7	74.0	76.6	76.1
Skilled	67.8	66.8	67.7	67.1
Semiskilled	72.5	71.7	72.8	73.0
Unskilled and agricultural	75.8	75.0	76.9	77.4
Entry	43.7	50.2	45.0	54.2

Lowest levels of educational attainment were reported for jobseekers with unskilled, semiskilled, and service occupations. In these groups better than seven out of ten jobseekers had not finished high school. The percentages were slightly higher for men.

Relatively few candidates with professional, technical, managerial, clerical and sales skills, on the other hand, dropped out of school before receiving their high school diplomas. At the latest count only one out of six in the professional and managerial group, and one out of four in the clerical and sales group were dropouts. The proportions had declined for both groups.

It might also be expected that the younger jobseekers had somewhat higher levels of formal education than those who were older.

Again singling out those who did not graduate from high school by age group, the proportions follow:

Age Group	Total 1962	Total 1965	Men 1962	Men 1965
Total	61.8	60.1	65.5	65.3
Under 20	49.3	54.3	56.4	61.6
20 - 24	42.5	42.5	47.4	48.7
25 - 34	58.1	57.4	60.8	61.4
35 - 44	65.6	65.5	69.3	71.2
45 - 54	71.9	69.4	74.7	73.9
55 - 64	82.9	79.9	85.3	82.6
65 and over	83.1	82.7	84.8	85.3

Among the youth under 20 the proportion who had not finished high school rose from 49 to 54 percent between the two counts. Above this age group, however, the percentage of dropouts rose with age. Whereas only 43 percent of those 20 through 24 did not graduate from high school, 83 percent of those 65 years of age or older did not continue in school long enough to receive high school diplomas. The percentages were consistently higher for men in each age group than for total jobseekers.

Registrants with the lowest levels of education--unskilled, semiskilled and service workers--accounted for more than one-half the total number of jobseekers--55 percent in 1962 and 52 percent in 1965. The proportions were even higher for men jobseekers, as shown below:

Occupational Group	Total 1962	Total 1965	Men 1962	Men 1965
Total	100.0	100.0	100.0	100.0
Professional and managerial ..	3.0	3.1	3.5	3.6
Clerical and sales	13.9	13.4	6.3	6.0
Service	11.2	10.7	6.3	6.4
Skilled	17.1	14.0	24.0	20.4
Semiskilled	21.6	20.1	25.0	23.4
Unskilled and agricultural ...	22.0	21.0	25.2	24.7
Entry	11.3	17.7	9.9	15.5

Jobseekers in entry classifications rose from 11 percent in 1962 to nearly 18 percent in 1965. At the time of the earlier count only 44 percent so-classified had not finished high school. By April 1965 this figure had risen to 50 percent. The rise was due to a substantial increase, between the two counts, among those in entry occupations with "some high school." This group added one-fifth to its total--increasing from 7,927 to 9,486--in the face of declines for every other occupational group. Jobseekers under 20 years of age accounted for much of the increase. This age group, with "some high school," jumped 34 percent between 1962 and 1965, from 6,075 to 8,139.

The great influx of young people into the Ohio labor market in recent years and the relative lack of job openings for which they were qualified by education, or otherwise, is reflected in the growth in the number of jobseekers under 20. Their 1962 count totaled 14,394. Three years later this figure had risen 18 percent, to 16,971. This was the only age group whose total did not show a substantial decline between the two counts. Whereas fewer than 7 percent of all the registered jobseekers were under 20 at the time of the 1962 count, this figure reached nearly 13 percent three years later.

AREA ANALYSIS

Ohio has eight counties, each with a city of 100,000 or more in population. They are all metropolitan counties which, in the aggregate, account for most of the jobseekers in the State. These counties are Cuyahoga, Franklin, Hamilton, Lucas, Mahoning, Montgomery, Stark, and Summit.

It was not possible, in the earlier survey, to tabulate jobseekers registered, by county. Where a given office served an adjacent county or counties, the figures were combined for the area served. Although the latest survey does provide data by county, in order to compare the two surveys the same counties were summarized so that the combined data for the eight large counties embrace eight additional smaller counties served in 1962 by these large counties (see second Appendix map).

Twenty-one counties in Southeastern Ohio posed a similar problem in providing geographic comparability for the two counts. These counties, within the so-called Appalachian Area, account for a relatively small share of the State's jobseekers. The dominance of the eight large-county areas is reflected in the percentages below:

Area	Total		Men	
	1962	1965	1962	1965
Total	100.0	100.0	100.0	100.0
Eight large county areas (16) ..	59.5	57.1	59.7	58.4
Southeastern counties (21)	9.5	11.0	10.0	11.8
All other counties (51)	31.0	31.9	30.3	29.8

Inclusion of data for eight smaller counties in the total for those served by the eight largest had relatively little effect on the

aggregate. In the 1965 count the 16 counties embraced in the area served by offices in the eight largest accounted for 57 percent of all the registered jobseekers in Ohio. Offices in the eight largest counties alone, however, accounted for 54 percent.

Data for areas served by offices in the larger counties greatly affect and largely control the statewide figures. Southeastern Ohio for at least a quarter-century has been an area of relatively limited employment opportunity, doubtless affecting the volume, age composition, skills, and educational attainment of jobseekers in the area. Comparisons might therefore be most meaningful between the 16 counties in the industrialized areas--the large county areas accounting for nearly three-fifths of the State's jobseekers--and the 51 counties outside Southeastern Ohio, with nearly one-third. Nine out of every ten jobseekers in Ohio were among these 67 counties, at the latest count.

In the percentage comparisons which follow, the "large areas" are defined as the 16 counties served by offices in the eight largest, while the "small areas" represent the 51 counties outside the 21 in "Southeastern Ohio."

Educational Attainment	Large Areas		Small Areas	
	1962	1965	1962	1965
Total	100.0	100.0	100.0	100.0
Eight grades or fewer	30.1	26.5	27.6	23.0
Some high school	32.8	34.1	32.3	35.4
High school graduate	28.6	30.1	33.8	34.7
Some college	6.8	7.5	5.5	6.0
College graduate	1.7	1.8	.9	.9

Jobseekers both in the large and small areas showed improvement, between the two counts, in their levels of formal educational attainment.

In the large areas, however, the proportion who did not finish high school was moderately higher than in the small areas. On the other hand, the percentage with college training was also somewhat greater in the large areas. The latter pattern probably reflects not only easier accessibility to colleges and universities in the larger cities, but also greater demands in such areas for college-trained personnel.

The extent to which jobseekers in these two groups of counties did not finish high school is indicated, by occupational group, as follows:

Occupational Group	Large Areas		Small Areas	
	1962	1965	1962	1965
Total	62.9	60.6	59.9	58.4
Professional and managerial ..	16.9	14.8	21.9	17.9
Clerical and sales	30.7	25.2	26.4	23.1
Service	74.9	75.0	74.4	72.9
Skilled	68.5	68.8	66.7	62.9
Semiskilled	74.1	74.8	69.6	67.4
Unskilled and agricultural ...	78.2	77.4	72.1	71.2
Entry	46.6	46.9	42.2	53.0

In the large areas three out of four service and semiskilled jobseekers did not finish high school. The proportion was slightly higher for unskilled workers. Although the percentages were similarly high in the small areas, they were smaller than in the large areas, with a better pattern of improvement between 1962 and 1965. The percentage of professional, technical, and managerial candidates without high school diplomas, however, was greater in the small than in the large areas. In all likelihood, opportunities for employment of candidates with such skills were greater in the large areas.

Variations in age distributions among candidates for jobs in the two areas who did not finish high school are presented, in percentages, below:

Age Group	Large Areas 1962	Large Areas 1965	Small Areas 1962	Small Areas 1965
Total	62.9	60.6	59.9	58.4
Under 20	55.6	54.3	46.7	54.4
20 - 24	43.4	42.0	41.9	43.2
25 - 34	58.4	57.8	58.3	56.2
35 - 44	65.7	65.4	64.8	64.4
45 - 54	72.7	69.5	68.8	67.4
55 - 64	82.8	79.7	81.7	78.1
65 and over	83.1	82.6	82.1	81.9

Among youth under 20 the percentage who did not complete high school increased in the small areas between 1962 and 1965. For the group from 20 through 24, similar increases occurred in the small areas. For those 25 and over, moderate improvement was apparent, although the proportions were higher than for the younger group, and rose with more advanced age.

The relative distributions of registered jobseekers by skill, as between the two groups of counties for the two counts, follow:

Occupational Group	Large Areas 1962	Large Areas 1965	Small Areas 1962	Small Areas 1965
Total	100.0	100.0	100.0	100.0
Professional and managerial ..	3.3	3.7	2.7	2.5
Clerical and sales	14.8	14.7	12.8	12.3
Service	11.7	11.2	10.2	10.6
Skilled	16.2	14.2	18.2	12.9
Semiskilled	20.9	19.3	22.4	21.2
Unskilled and agricultural ...	22.3	21.3	21.2	19.5
Entry	10.7	15.7	12.5	21.1

Especially notable in the data above are the marked gains in both areas, in the percentages classified in entry occupations. Also

noteworthy is the much greater relative shrinkage of skilled workers in the small areas between the two counts, as compared with the large areas.

This may be due to out-migration of skilled workers from the small areas or to greater relative demand for such workers locally. Since skilled workers tend to be heavily concentrated in manufacturing industries in the large industrial centers, and since such industries have been booming since 1962, the explanation probably lies in greater out-migration from small areas than from the large areas. The smaller share of white-collar jobseekers--professional, technical, clerical, and sales--in the small areas may be similarly explained, except that opportunities for such workers were probably greater in nonmanufacturing industries in the urban centers.

The Southeastern Ohio counties are all relatively small in terms of population and labor force. In the aggregate, the 21 counties so-defined for purposes of this study[1], accounted for 11 percent of the State's jobseekers at the latest count. The 51 counties outside those embraced in the area served by the eight largest were also relatively small, accounting for less than one-third of Ohio's registered jobseekers in 1965. Over the years, however, job prospects have generally been better in the smaller counties outside Southeastern Ohio than in Southeastern Ohio. Comparison of the registered jobseekers, therefore, in the 51 counties defined as small areas with those in the 21 counties of Southeastern Ohio may be of interest. Formal educational attainments, in percentages of jobseekers at each level, follow for the two groups of counties:

---

[1]See second Appendix map. See also Papier, William, "Ohio Seeks Economic Balance," Employment Security Review, December 1953, U.S. Government Printing Office, Washington, D.C.

Educational Attainment	Small Areas 1962	Small Areas 1965	Southeast Areas 1962	Southeast Areas 1965
Total	100.0	100.0	100.0	100.0
Eight grades or fewer	27.6	23.0	32.6	29.9
Some high school	32.3	35.4	27.8	31.8
High school graduate	33.8	34.7	34.8	33.1
Some college	5.5	6.0	4.3	4.6
College graduate	.9	.9	.6	.6

Whereas the proportion who did not finish high school dropped slightly between the two counts in the small areas, a moderate increase occurred in Southeastern Ohio. The reverse pattern appeared with respect to high school graduates. Both groups, however, increased their shares of jobseekers who had some college training but did not graduate from college.

The proportions of registered jobseekers at the various skill levels in the two groups of smaller counties who did not finish school follow:

Occupational Group	Small Areas 1962	Small Areas 1965	Southeast Areas 1962	Southeast Areas 1965
Total	59.9	58.4	60.4	61.7
Professional and managerial ..	21.9	17.9	28.7	19.5
Clerical and sales	26.4	23.1	23.2	20.5
Service	74.4	72.9	74.9	71.5
Skilled	66.7	62.9	67.5	66.7
Semiskilled	69.6	67.4	72.1	69.7
Unskilled and agricultural ...	72.1	71.2	72.0	73.2
Entry	42.2	53.0	30.8	54.9

The percentages who did not finish high school were somewhat higher in Southeastern Ohio than in the small areas elsewhere, at the time of both counts. This was not the case, however, for clerical and sales workers, or, in 1962 for entry workers, and in 1965 for service workers. Both groups of counties experienced notable gains in the proportions

assigned entry classifications who had not finished high school, with an especially sharp rise for such applicants in Southeastern Ohio.

The age distributions of jobseekers in the two areas are compared below, again showing percentages who did not finish high school:

Age Group	Small Areas 1962	Small Areas 1965	Southeast Areas 1962	Southeast Areas 1965
Total	59.9	58.4	60.4	61.7
Under 20	46.7	54.4	31.4	53.8
20 - 24	41.9	43.2	39.3	43.0
25 - 34	58.3	56.2	55.7	57.9
35 - 44	64.8	64.4	67.5	69.0
45 - 54	68.8	67.4	76.3	73.7
55 - 64	81.7	78.1	87.5	85.2
65 and over	82.1	81.9	87.9	86.0

For those 35 years of age and over, the percentages who did not finish high school were greater in Southeastern Ohio than in other small areas, at both surveys. In 1965, this was true for all jobseekers 25 years of age or older. The percentages who failed to complete high school generally increased with age. Over 85 percent of those over 54 years of age in Southeastern Ohio had not finished high school.

Percentages of registered jobseekers by skill are compared below for the two groups of small counties:

Occupational Group	Small Areas 1962	Small Areas 1965	Southeast Areas 1962	Southeast Areas 1965
Total	100.0	100.0	100.0	100.0
Professional and managerial ..	2.7	2.5	2.1	1.9
Clerical and sales	12.8	12.3	11.7	9.9
Service	10.2	10.6	10.5	8.4
Skilled	18.2	12.9	19.5	16.6
Semiskilled	22.4	21.2	23.0	21.2
Unskilled and agricultural ...	21.2	19.5	22.3	24.2
Entry	12.5	21.1	10.8	17.8

The proportions of entry and white-collar jobseekers were lower at both counts in Southeastern Ohio than in the other small areas. The percentages of skilled as well as unskilled workers, however, were higher.

SUMMARY AND COMMENTARY

It would be possible, from the data appended, to comment individually on the patterns of educational attainment of jobseekers registered with the Ohio State Employment Service in each of Ohio's 88 counties. This was not done, in part because of a high degree of similarity in broad patterns, such as the extent to which candidates finished high school. A further consideration was the desire to publish and make these data available while they were still timely.

Perhaps the most striking fact observed is the remarkably high dropout rate among the registered jobseekers--defining that rate as the percentage who failed to graduate from high school. At the latest count, better than one out of four had no formal education beyond the eighth grade. One out of three had some high school training, but not enough to graduate. Thus three out of five jobseekers had no high school diplomas. Those who finished high school but did not go on to college represented one-third of the total registered. The rest--fewer than one out of twelve--had some college training or degrees.

Those groups which were numerically among the largest, probably embracing candidates in greatest need of employment, had relatively low levels of formal education. The men, for example, outnumbered the women nearly two-to-one. Yet the women, on the whole, had a higher level of educational attainment.

More than one-half the total registered jobseekers were unskilled, semiskilled, or service workers. These were the candidates heavily concentrated at the lower levels of the educational scale.

One out of four applicants was 45 years of age or older. The highest proportion of dropouts was among these older jobseekers.

As might be expected, jobseekers were heavily concentrated in the more industrialized urban centers of Ohio. Nearly three out of five were served by offices in the eight most populous counties. Candidates in these large urban centers, as a rule, had higher dropout rates than jobseekers in the more rural areas.

In Southeastern Ohio the percentage who failed to finish high school was higher than that in similar small areas elsewhere in the State. Furthermore, this dropout rate increased in Southeastern Ohio between 1962 and 1965, in contrast with the general pattern elsewhere.

The statewide record indicates moderate improvement in the level of formal educational attainment of registered jobseekers between 1962 and 1965. Nevertheless, this is hardly impressive, especially in the light of widespread demands for higher and higher levels of training and skill.

It would be both unrealistic and unsound to lower job specifications, insofar as education and skill are concerned, in order to enhance employment prospects for those who solicit the aid of public employment offices. This could only lower living standards through curtailed productivity, higher costs, and deterioration in the quality of goods and services. The alternative, clearly, must be that of improving the qualifications of jobseekers, through a broad range of public and private efforts--through formal education to the highest level of student interest and ability--through vocational, on-the-job, and apprentice training--and through widespread programs of adult education.

Educational and Vocational Goals of Rural Youth in the South. (Southern Cooperative Bulletin no. 107).

Southern Regional Committee for Family Life

Sep65

EDRS Price MF-$0.09 HC-$1.44 36p.

*RURAL YOUTH, *EDUCATIONAL ATTITUDES, GRADE 9, GRADE 10, YOUTH CLUBS, *HIGH SCHOOL STUDENTS, *VOCATIONAL INTERESTS, *PARENT ATTITUDES, BACKGROUND, SEX (CHARACTERISTICS),

Kentucky, North Carolina, Tennessee, Virginia,

The objectives of the study were to -- (1) compare educational goals of rural youth and their parents, and (2) determine the relationships of the similarities and differences to such factors as geographic area, state, sex, level of living, residence, family size, and club membership. A survey sample, selected from an equi-partitioned universe characterized by rural residence and school size, included six ninth and 10th grade children from each of 48 subgroups in Kentucky, North Carolina, Tennessee, and Virginia. Questionnaires and interest inventories were administered. Boys preferred outdoor, mechanical, computational, scientific and persuasive activities, while girls preferred artistic, literary, social service, musical and clerical activities. Mothers encouraged continuance of education more strongly than fathers. No differences in educational and vocational plans were found between members and nonmembers of 4-H Clubs, Future Homemakers of America, and Future Farmers of America. Youth's educational expectations increased in relation to level of living background. (JM)

SOUTHERN COOPERATIVE SERIES

Bulletin No. 107

This bulletin is the 107th in the series of Southern Cooperative Bulletins. Under the procedure of cooperative publication, Bulletin No. 107 becomes, in effect, a separate publication for each of the cooperating stations and is mailed under the frank and indicia for each of the cooperating stations.

Since the bulletin is identical for all the stations, it is suggested that copies be requested from only one source.

Requests from outside the cooperating states should be mailed to the North Carolina Agricultural Experiment Station.

W. A. Seay, Director, Kentucky Agricultural Experiment Station, Lexington, Kentucky.

R. L. Lovvorn, Director, North Carolina Agricultural Experiment Station, Raleigh, North Carolina.

J. A. Ewing, Director, Tennessee Agricultural Experiment Station, Knoxville, Tennessee.

Coyt Wilson, Director, Virginia Agricultural Experiment Station, Blacksburg, Virginia.

ACKNOWLEDGEMENTS

This report was prepared by the state members of the Technical Committee for Project S-48 with the assistance of the Administrative Adviser, C.S.R.S. Representatives, and Consulting Statistician.

In addition to those contributors listed on the opposite page, acknowledgement is made to the following persons who assisted with this study at various stages during its development: A. L. Finkner, Statistician, Research Triangle, North Carolina, for his assistance with the statistical design; Harold L. Holloway, Texas State College for Women, for his assistance with the project outline and development; Henry Leveck, Mississippi Agricultural Experiment Station, Former Administrative Adviser; Helen R. Marshall, Drexel Institute, for her assistance with the development of the project; Darby J. Reed, for her assistance with the initial work in Tennessee; and Nancy M. Myers, for her assistance with the initial work in North Carolina.

Acknowledgement is made to the Department of Experimental Statistics, North Carolina State University for its compilation of the data. Appreciation is also expressed to the North Carolina Agricultural Experiment Station for the publication of this report.

The Technical Committee is deeply indebted to the rural school administrators, youth, and parents from the contributing states whose cooperation made this study possible.

SOUTHERN REGIONAL COMMITTEE FOR FAMILY LIFE

Administrative Advisers:

Kenneth R. Keller, Assistant Director in Charge of Tobacco Research, North Carolina Agricultural Experiment Station, Raleigh

Mary Beth Minden, Representative, Cooperative State Research Service, Washington

Paul J. Jehlik, Alternate Representative, Cooperative State Research Service, Washington

State Members:

Irwin V. Sperry, Chairman, Technical Committee, University of North Carolina at Greensboro

Vira R. Kivett, Secretary, Technical Committee, University of North Carolina at Greensboro

Ruth L. Highberger, University of Tennessee

Betty I. Jeffrey, University of Tennessee

Shirley Newsom, University of Kentucky

Virle C. Payne, Virginia Polytechnic Institute

Cooperators:

Kentucky Agricultural Experiment Station and School of Home Economics, University of Kentucky, Lexington

North Carolina Agricultural Experiment Station and School of Home Economics, University of North Carolina, Greensboro

Tennessee Agricultural Experiment Station and College of Home Economics, University of Tennessee, Knoxville

Virginia Agricultural Experiment Station and Department of Home Economics, Virginia Polytechnic Institute, Blacksburg

United States Department of Agriculture, Washington

Consulting Statistician:

Charles Proctor, Department of Experimental Statistics, North Carolina State University, Raleigh

This bulletin was accepted for publication in September, 1965. The list of names above represents the committee composition at the time of development of the manuscript.

EDUCATIONAL AND VOCATIONAL GOALS OF RURAL YOUTH IN THE SOUTH

Introduction

The present day emphasis given the President's economic opportunities program reinforces previous concern over the rural population's educational and vocational aspirations and expectations. The relationships between education, occupation, and level of living have been amply established. That the educational goals of rural youth are generally surpassed by those of urban youth is likewise recognized.

For some time now several organizations available to rural youth have incorporated into their programs units pertaining to careers. These programs were designed to enlighten rural youth in terms of job opportunities and requirements. In 1961, objectives of the 4-H program included as a longtime and annual county goal "have the youth in the 16-20 year group improve their understanding of career and employment requirements and opportunities" (6). In Future Farmers of America and in Future Homemakers of America general objectives are "to develop competent, aggressive, rural agricultural leadership" and "to help individuals improve personal, family, and community living," respectively (38, 27). Purposes also listed include furthering interest in agriculture and home economics.

A concern for a better understanding of certain of the rural population's educational and vocational goals and some factors possibly related to these goals led to the present study. The objectives of this cooperative project were: (1) to describe similarities and differences in educational and vocational goals of rural youth and of their parents for them; and (2) to determine the relationships of the similarities and differences in these goals to such factors as (a) geographic area; (b) state; (c) sex; (d) level of living; (e) farm or nonfarm residence; (f) family size; and (g) membership in certain rural youth organizations.[1]

Two reviews have recently summarized available research on educational and occupational goals of rural youth and their families (3, 15). The present account, therefore, will discuss, first, studies as to the age level of youth chosen for study, and then, in turn, available findings on the other six independent variables of the present survey affecting youths' expressed attitudes and aspirations and those of their parents.

[1] See page 9 for definition of the variables employed in this study.

Age and the Choice Process

Evidence from earlier research has indicated that occupational interest begins to stabilize in the ninth grade (35). There is support also that many decisions having a bearing on college and occupational plans are made several years prior to the senior year in high school, as the young person chooses school subjects, activities, and friends (30, 23, 31). The importance of gaining information from young adolescents has been further emphasized through a study of rural youth in Iowa in which it was found that boys and girls who wanted to become farmers or farm wives made their decision early in high school and then became less flexible about their choice than other youths (5, 4).

State and Area within State

Considerable variability among economic regions and subregions is usually attributed to the labor force as well as to the availability of jobs for new entrants to the labor force. Some rural areas provide only subsistence farming and unskilled labor of a seasonal nature whereas other areas have been found to be highly industrialized counties with a minimum of differences in terms of rural-urban aspirational levels (37, 19).

In each of the states contributing to this study, agriculture has shown a decline while industrialization has spread into those geographical locations affording adequate sources of raw materials, transportation, or manpower. Manufacturers contributing to a rapid industrial development in the southern area included here have been the extractive, tobacco, food, pulp and paper, chemical, furniture, and textile industries. It should be pointed out that agriculture, none the less, still remains a major element in the economy of many sections of the Southern Appalachian area.

The distinct difference which area within a state may make in occupational planning is illustrated in the work of Schwarzweller (33) in studying young men who did and did not leave poorer farming areas of Eastern Kentucky. The influence of industrialization was similarly seen in Ford's (17) Appalachian survey which pictured conditions and opinions in the mountain areas of the four states involved in the present study. Evidence was produced that these areas are no longer isolated in thinking and in educational values. Many organizational differences in educational systems exist among states. Consequently, no attempt has been made to generalize for the four-state area.

Sex Comparisons

Ford's (17) survey pointed out that earlier disparities in regard to education of boys and girls are being erased in rural mountainous areas even more than in urban localities. In a national survey of 14 to

18 year olds reported by Douvan (10), it was shown that percentages of high school boys expecting to attend college increased during high school years. In another study of 14 to 18 year old girls, Douvan (12) reported that the percentage of girls expecting to attend college diminished during the high school years.

Studies using the Kuder interest inventory have repeatedly confirmed the sex differences which led its originators to provide separate norms and profiles for boys and for girls. A study of tenth grade Ohio youth indicated that parents showed more agreement with respect to their daughter's top interest rather than their son's. Youth-parent agreement varied according to the sex of the youth and to the particular field of interest (22).

In many of the occupational choice studies made, residence differences have appeared for boys but not for girls (1, 2, 11, 13). Authors have often attributed this phenomenon to the secondary importance girls give to employment.

Level of Living

The relation between socioeconomic level and the hopes and efforts of young people toward their future life work has been a consistent observation (3, 28). Larger percentages of high than of low socioeconomic status youth have been found to continue their formal education in Pennsylvania (2), New Jersey (18), Washington (14), Indiana (8), and in Utah (7). In Kentucky socioeconomic status of the family was found to be particularly influential for boys (32). In two South Appalachian studies the general economic level of the whole community in which the youth grew up was noted to be of significance in their decisions regarding education (16, 33).

Residence

Although most studies of educational and occupational goals have pointed toward rural-urban differences, Haller (20) found no significant difference in the aspirations of farm and nonfarm rural boys when occupational opportunities other than farming were controlled.

There is little question that farm boys planning to farm differ in their value orientations from boys not planning to farm (20, 24, 36). They prefer rural living, outdoor work, work involving physical activity and the use of machinery, and work involving little contact with people.

Family Size

Family size has received little attention in studies related to choices of academic subjects, college attendance, or occupational choice. Edlefsen (14) reported that the only child expressed more certainty of

entering college than did those having brothers and sisters. Nam and Cowhig's (26) nation-wide study of factors related to college attendance indicated a slight negative influence of family size on numbers of youth actually reaching college who had planned to attend in the fall of their senior year. Elder (15), reviewing data concerning achievement orientations and career patterns of rural youth, noted that the size of the family determines theoretical maximum financial support for each child. Strauss' (36) investigation of personal characteristic and functional needs in the choice of farming as an occupation noted that family size did not influence choice of farming.

Membership In Organizations

Membership in rural youth groups as a variable in studies of occupational plans has occurred in relation to choice of farming. Kaldor (24) found length of 4-H Club membership was not greatly different between boys planning to farm and other boys. As might be expected, boys planning to farm were more frequently members of FFA. A study concerning career choices among 4-H Club members in Virginia reported that members listed the local 4-H leader and participation in the 4-H Career Exploration as most helpful in learning about careers (34).

Procedures

The Technical Committee for the regional project established the procedures to be followed by all contributing states. A complete study was carried out in each state, and later, data were pooled in order to obtain a four-state analysis.

The sample of ninth and tenth graders was designed to include six children from each state in each of 48 subgroups. There were 48 combinations of two sexes by two membership roles by three levels of living by two residences by two family sizes ($48=2 \cdot 3 \cdot 2 \cdot 2 \cdot 2$). The six students were spread geographically over the state—two from each of three areas.[2] The design ultimately called for a state sample of 288 youth, their mothers and their fathers.

Student information sheets which served to classify youth as to subgroup, were administered to the ninth and tenth grade students of randomly selected schools. The public schools of each state which were predominantly white, non-parochial, not located within corporate limits of cities of 50,000 or more and had chapters of FFA, or FHA or 4-H were visited in random order. Students who lived with both parents at a rural residence were eligible for selection which was

[2] These areas were delimited on the basis of soil and type of farming. Areas within the states usually took the names Eastern, Central, and Western areas.

made at random in randomly selected subgroups for each school visited.[3] The total sample included 285 cases in Kentucky, 281 in North Carolina, 288 in Tennessee, and 285 in Virginia.

The selection of the sample, then measurement of youths' attitudes toward an education, their educational and occupational plans, and vocational preferences required three visits to each school. Questionnaires identical to those of the youth were administered by an interviewer to mothers and fathers in their homes. Parents were asked to answer the questionnaires as they hoped their sons or daughters answered them at school.

Data Analyses

Analyses of variance were employed to point out notable differences among means on educational questionnaire scores and vocational preference subscores for seven control variables. These variables included: sex, boy or girl; membership, with a background of at least one semester in FFA or FHA, or one year in 4-H Club against no such background; level of living, interpreted as high, middle, or low as measured by a level of living scale;[4] residence, interpreted as farm or nonfarm; family size, defined as 1-2 child family or 3 or more child family; state, Kentucky, North Carolina, Tennessee, or Virginia; and area, the three areas in each state as determined by soil type. The three areas of each state would be said, in analysis of variance parlance, to be *nested* in the state classification and then both were *crossed* with all of the other five variables.

In this study, data from a survey have been analyzed by analysis of variance methods developed largely for handling data from experiments. Our terminology (e.g. "control variables" and "effects") has been colored by the experimentalist and we must take care that our interpretations do not suffer from a confusion of survey and experiment. In the first place the sample was not representative of the population of ninth and tenth graders in their proper proportions. For example, children of small families and lower levels of living were relatively scarce in the population but they were equally represented in the sample. In North Carolina, where the tally sheets used in drawing the sample were examined, it was found that in the schools visited there were as many as 532 boy nonmembers of middle level of living nonfarm residents and from large farm families and as few as 13 boy members of low level of living nonfarm residences and small family size in a partition. Our sample can be called "equipartitioned" rather than "representative."

[3] In North Carolina, for example, 6,923 eligible students were contacted in the 51 schools visited. Of this number, 3,557 were boys; 2,827 were members; 1,899 were in low, 3,509 in middle, and 1,515 were in high level of living groups; 2,790 were living on farms; and 1,844 came from small size families.

[4] An adaptation of the Cornell Level of Living Scale (9).

Next, keeping in mind the equi-partitioned universe from which our equi-partitioned sample was drawn, we chose to generalize to only the four-state geographic "region." The state variable was treated as fixed. The reader who wonders whether an effect might be more widespread geographically would do well to see if it interacted with the state variable and not expect its persistence if there were an interaction (Tables 1, 2 and 3).

Readers when applying our findings in their work with youth would not expect to manipulate the "control" variables of this study, but rather, will manipulate their own actions in accord with the control variable values of the youth with which they deal. For example, one will not change residences but will take note of them. To say that there was a "sex main effect" is simply a rather misleading way of saying there was a difference between boys and girls (One should add "in the equi-partitioned universe.").

* See notation, bottom of Table 1.

The shape of the distribution of deviations between observed educational questionnaire scores and the fitted subgroup means was a little flat in the center but still passably close to the bell-shaped normal distribution. In no case, among the 33 variables analyzed, did the higher-than-second-order pooled interaction mean square exceed to any extent the within subgroup mean square. These two results gave evidence that use of the F-tables was probably quite proper.

Every first order effect and all two-way interactions for each of the six factors (area in state and state were considered as one factor) were tested for each of the 33 analyses. This involved 22 x 33 = 726 tests and even with purely random data about 36 rejections at the 5 percent level would be found. Tables 1, 2, and 3 show considerably more cases of rejection but it should be recognized that 10 or 20 could have occurred by chance.

* See notation, bottom of Table 1.

Contingency table chi-square values were used to signal significant associations between vocational questionnaire items and sex, level of living, family size, residence, and membership status. Data on these items were analyzed separately for each state for boys and for girls and for parents of boys and for parents of girls. The total number of chi-square tables examined was 240. Only those associations reaching a significant level in two or more states (a total of 23) were considered for description. While chi-square probably does a good job of indicating differences in proportions responding to the items from boys to girls, from members to nonmembers and so forth, it does not take into account the stratification, in equi-partitioned style, of the sample. In an example worked in detail it was found that the chi-

square test did not detect a difference at the .01 level when a test accounting for the stratified nature of the sample did show such a relationship. This indicates that the chi-square test may be an overly conservative procedure.

Educational Attitude Scores

The Hieronymous questionnaire, Attitude Toward Education, was administered to the students, and later, each of their parents was asked to respond to the statements as they hoped their youngster had answered them. This scale was designed to test the student's opinion as to the value of an education in general rather than on his attitude toward the educational practices of the school which he was attending. The scale was constructed by the method of summated ratings. Two types of items were included, (1) a number of favorable and unfavorable statements about the value of an education, such as:

The most common way in which poor people raise their standard of living is through education.

A. Strongly Agree B. Agree C. Undecided D. Disagree E. Strongly Disagree

and; (2) a number of multiple choice items depicting student situations in life which reflected the value placed upon education, such as:

How much of the time do you enjoy being in school?

a) All the time
b) Most of the time
c) Fairly often
d) Hardly ever
e) Never

Although the principal focus of this study was on differences in score averages—differences associated with changes in the subgroupings of the sample—an appreciation of these differences can best be gained by observing the overall level of the scores and their range of variation. This base line information is provided in Table 4.

For the equi-partitioned sample the mean score on the educational value scale was 181.7.[5] This was an estimate of the mean of the equi-partitioned population and had a standard error of estimate of .44 score points. Such a value suggested that had the entire eligible school populations of all four states been measured, re-measured again and again, and the resulting mean scores for each subgroup been averaged, then the result would not be further away from 181.7 than perhaps twice .44. We "know" the average to be in the range 181 and 183; if it is not then our sample is truly an unlikely one.

The standard deviation of 14.7 (see Table 4) indicates how much one youth differed from the next when they were both in the same

[5] The mean for the equi-partitioned sample in North Carolina was 183.0. When each partition was expanded by the reciprocal of its sampling fraction the estimated mean in the actual population was 182.7. The similarity of these two results show that in this case a survey of the school population in North Carolina would have given a mean educational score close to that for the equi-partitioned sample.

Table 4. Educational Score Mean and Kuder Vocational Score Means, Standard Errors of the Means and Score Standard Deviations for Youth and Parent-Minus-Youth Differences

subgroup. Whatever be the mean for a subgroup (some value near 181.7) about two-thirds of the youths' scores were within 14.7 points of this mean and 95 percent of them were within twice 14.7 or 29.4 score points of the mean. For example, while boys' and girls' means differed by 6 points it should be understood that a good many boys had scores above a good many girls even though the mean for girls was 6 points higher than the mean for boys.

Youths' educational questionnaire scores varied according to state, sex, level of living, residence, and family size.[6] Girls' mean score was higher by 5.8 points than that of boys, nonfarm youths' score exceeded that of farm youth by 2.5 points, and the mean score of youth from small family backgrounds was higher by 1.9 points than that of youth from larger families. The level of living effect revealed higher scores than the mean among youth from high (by 2.8 points) and middle (by .74 points) level of living backgrounds than among youth in the low level of living group who scored 3.6 points lower than the average.

Parent-son score disparities contributed primarily to youth-parent score differences on the educational questionnaire. Whereas boys' educational mean score was lower by 4.5 points than their fathers' score, girls' score was higher by 2.0 points than that of their fathers. Girls' mean score approximated their mothers' score (a difference of only .24 points), while boys' score was less than their mothers' score by 6.8 points.

Vocational Preference Scores

The *Kuder Preference Record* was designed to measure an individual's occupational preferences in 10 broad areas. These areas in-

[6] No main effect by membership was noted but there was a state by membership interaction. In all states except Virginia, members had slightly higher educational scores than nonmembers. In Virginia members averaged 4.9 points less than nonmembers.

clude: Outdoor, Mechanical, Computational, Scientific, Persuasive, Artistic, Literary, Musical, Social Service, and Clerical. The instrument was developed upon the assumption that an individual's preferences indicate that he likes certain types of activities. Upon identification of these preferences he can investigate the occupations that involve these activities. The form consists of numerous activities set up in groups of three. The youth were asked to indicate which of the three activities they would most prefer, and secondly, which activity they would prefer least. The parents were asked to select the activity that they hoped their youngster most preferred, and then, the activity they hoped that he least preferred.

The predominance of the sex effect is evident in the first row of Tables 1, 2, and 3. This is no surprise with regard to vocational preferences as revealed by the Kuder and it may not be surprising for educational values. At any rate Table 5 is offered in lieu of any extended discussion at present of these sex differences. Boys exceeded girls in preferring mechanical and outdoor pursuits, while girls preferred clerical and social service more than boys. Mothers and fathers agreed with each other in opposing, if only in their hopes, this sex difference exhibited by their children.

Although outdoor and mechanical interests were prime examples of youth-mother and youth-father differences, clerical, social service and scientific preferences were also involved. For example, boys showed much more mechanical interest than girls (by 23.0 points). Fathers of boys hoped their sons would be less interested in mechanical by .7 of a point, while fathers of daughters hoped the reverse to the extent of 10.9 points; the difference was between −.7 and +10.9 which is shown as —11.5 in Table 5 (Fathers of Boys-Fathers of Girls)-(Boys-Girls). Also mothers of boys hoped their sons would be less interested in mechanical by 9.1 points while mothers of girls

Table 5. Average Differences, Boys' Score Minus Girls' Score, for 33 Variables

	Youths' Scores	Father Minus Youth	Mother Minus Youth
Educational	− 5.8	6.4	6.5
Outdoor	20.4*	−12.3*	−10.0*
Mechanical	23.0*	−11.5*	−10.2
Computational	3.0*	− 3.1	− 2.1*
Scientific	10.5	− 5.9	− 3.8*
Persuasive	1.6	− 1.6	− 1.1†
Artistic	− 3.2*	1.7	.8†
Literary	− 3.1	1.4	1.4
Musical	− 5.9*	2.7*	2.1*
Social Service	−10.1*	7.2	6.4
Clerical	−13.0	5.1*	4.7*

† Not a significant difference

* A state-with-sex interaction is also present.

hoped the reverse to the extent of 1.1 points; the difference shown is −10.2.

The *outdoor* scores changed by membership status and residence and were more apparent for boys than for girls. The means as seen in Table 6 show the pattern and point to the relatively low position of the nonfarm, nonmember boys on outdoor scores.

Table 6. Outdoor Score Means of Boys and Girls According to Residence and Membership

	Boys		Girls	
	Farm	Nonfarm	Farm	Nonfarm
Members	53.3	50.8	29.4	28.2
Nonmembers	51.0	42.3	30.8	27.4

Membership and residence differences appeared on the *mechanical* preference scores: a higher mean was found among farm youth (33.2) than among nonfarm youth (31.9), and among members it was 33.7 while nonmembers had 31.4.

Membership again was a "statistically significant" factor in *computational* preferences, where nonmembers' average score exceeded that of members by 1.3 points. This was, however, a slight score difference and was almost completely confined to the higher level of living youth.

Scientific preference scores were associated with level of living—averaging 39.4 for high, 38.1 for middle, and 34.9 for low level of living subpopulations. This relationship was seen to change more rapidly between low and middle than between middle and high. The nonfarm half of the sample had an average scientific preference score of 38.4 versus 36.6 for the farm half.

The *persuasive* scores were fairly uniform over the study subpopulations. A sex difference was found among the nonfarm half; 40.3 for boys versus 36.9 for girls, but not very much among the farm group; 38.4 for boys and 38.6 for girls.

The *artistic* scores followed residence and family size differences as Table 7 shows. The youth from small, farm families had notably lower scores on artistic preferences.

Table 7. Artistic Score Mean of Youth According to Residence and Family Size

	Family Size	
	Small Size	Large Size
Farm	25.2	27.6
Nonfarm	27.6	27.2

Literary scores were much the same, except for the sex differences already noted. *Musical* scores varied a bit by level of living from 13.8 to 13.2 to 12.7 from high to low levels of living. In North Carolina, however, the middle level of living group had the highest average

musical preference. On the *social service* subscale score, differences were slight.

The *clerical* scores showed changes in level by membership and level of living differences. The nonmembers scored an average of 55.3 against 53.8 for members. Along the level of living axis clerical score averages rose from 53.3 to 54.2 to 56.1 while levels of living changed from high to middle to low.

In Table 2 the effects signalled were so scattered that, other than those sex differences previously mentioned, we chose not to discuss them. In Table 3 the number of significant effects are, as in Table 2, not worthy of too much attention but the extreme level of two membership-by-residence interactions led to the presentation of table 8 showing mother-minus-youth score averages.

Membership differences were not the same among farm as among nonfarm youth. On clerical scores youth were closer to their mothers' scores among farm members and nonfarm nonmembers and showed differences (they were quite far below their mothers) among farm nonmembers and nonfarm members. Just the reverse of this pattern was found for girls on their outdoor scores; the farm member and nonfarm nonmember girls were further below their mothers' scores for them. Only the mothers of nonfarm, nonmember boys came at all close to the scores of their sons on outdoor preferences (Table 8).

Table 8. Mother Minus Youth Outdoor and Clerical Score Averages According to Residence and Membership

	Outdoor				Clerical (Youth Combined)	
	Boys		Girls			
	Farm	N. Farm	Farm	N. Farm	Farm	N. Farm
Members	−7.6	−10.2	3.5	1.4	2.4	6.3
Nonmembers	−9.6	− 4.3	1.2	2.2	5.7	3.3

Educational and Occupational Plans

The vocational questionnaire was constructed by the technical committee. Youth were asked their expectations or opinions in regard to: (1) length of schooling, (2) plans—noncollege, college, (3) degree of parental urging received to continue schooling, (4) degree of financial help—schooling, (5) occupation desired, (6) occupation expected, (7) parents' attitude toward plans, (8) parents' opinion of plans, and (9) degree of financial help—occupation. Parents of the youth were given the same questionnaire and they were asked to respond according to their expectations and opinions of their son's or daughter's future.

There was a remarkable similarity between boys and girls in their reported plans for further schooling. This similarity can be seen in Table 9. The general pattern—most youth planning to finish high school, half as many planning to finish college, with lesser numbers in other categories—was perhaps not surprising, but the point-to-point

Table 9. Length of Schooling Expected by Boys and Girls by Level of Living

Response to Length of Schooling Item	Boys Level of Living High	Mid.	Low	Total	Girls Level of Living High	Mid.	Low	Total
This will be last year	0	2	4	6	1	1	2	4
Another year or two	4	6	4	14	0	2	6	8
Finish high school	61	110	144	315	49	112	138	299
Begin college	11	13	7	31	15	13	5	33
Graduate from college	91	47	23	161	97	49	27	173
Continue professional study	26	14	4	44	26	15	8	49
Sums	193	192	186	571	188	192	186	566

correspondence between the sexes even within level of living groups was noteworthy.[7]

The association between schooling plans and level of living can also be seen in Table 9. The transition from finish-high-school plans to graduate-from-college plans marked the high level of living sector from the other two level of living groups. The middle level of living sector also had a different distribution of plans from the low but the number of those planning to finish high school was not too distinct.

When those youth who did not plan to go to college were asked what training they expected to get, the sex difference became pronounced (see Table 10). This was due primarily to the military training option chosen by the boys and additionally to their heavy choice of the "help my father" response. The relatively few youth who said they planned to go to work immediately is worth noting.[8]

Table 10. Noncollege Plans by Boys and Girls

Response to Item on Noncollege Plans	Boys	Girls
Take training course before working	58	168
Take apprentice or on-the-job training	23	19
Go to work immediately	19	30
Help my family at home (Girls)		9
Help my father in his occupation (Boys)	41	
Marriage as soon as I leave school (Girls)		17
Do military service (Boys)	109	
Undecided	102	97
Not applicable (planning college or non-response)	220	230
Sums	572	570

Youths' perceptions of their parents' urging to continue school were related to level of living in a way that suggested that their perceptions were probably realistic. Most of the results in Tables 11 and 12 support this observation. Boys and girls were quite similar although there was a suggestion ($X^2=24.6$ on 4DF is very impressive) that mothers of girls were seen more often as encouraging their daughters

[7] Remember, the sample is "equi-partitioned" and not "representative."

[8] This also applies to the "equi-partitioned" rather than a "representative" sample.

Table 11. Boys' and Girls' Perception of Fathers' Urging to Go on to School by Level of Living

Response to Urging Item	Boys Level of Living High	Mid.	Low	Total	Girls Level of Living High	Mid.	Low	Total
Has strongly urged me to continue	115	74	48	237	104	73	49	226

than were mothers of boys by their sons. Paternal encouragement was perceived about the same by sons and by daughters ($X^2=3.26$ on 4DF).

In terms of financial help for schooling, boys expected to be helped in slightly more cases than girls ($X^2=9.72$ on 4DF) as can be seen from the Total columns in Table 13. Again the fairly strong association with level of living is apparent in expectations for financial help with schooling.

Table 13. Financial Help for Schooling Expected by Boys and Girls by Level of Living

Response to Financial Help Item	Boys Level of Living High	Mid.	Low	Total	Girls Level of Living High	Mid.	Low	Total
Willing to pay completely	94	63	44	201	83	59	35	177

Very little help	47	37	47	131
No financial help	20	41	43	104
Sums	192	190	183	565

As noted in Table 14, the most distinguishing items for boys in terms of financial help for an occupation were "most of the help" and "no financial help." The middle and low level of living boys were very similar to one another while the high level of living boys were more often found responding "most of the help."

Parents' expectations regarding their youths' educational and occupational plans were arranged in tables similar to Tables 9 through 14. These tables are not included here because of their similarity to those of the youth. Ideally we would like to pair the response of a child with his or her parent, characterize the kind of agreement, and then look at the association between agreement and our control variables. With such results one could locate sectors where agreement was low and thus aid in spotting value disagreements between parents and youth.

When this program of analysis was carried out on the item asking for plans for further schooling, only sex and level of living showed strong differences and Table 15 exhibits them. As one goes from youth in the lower level of living to those in a higher level the disagreement with parents increases. Generally, youth and their parents had higher expectations of schooling when they were from a higher level of living

Table 15. Agreement and Direction of Disagreement between Parents and Youth on Plans for Further Schooling by Sex and Level of Living

but they did not always agree on the exact amount. This reflected, in part, the question wording which provided finely drawn distinctions concerning college plans. It should remind us, however, that where there are multiple alternatives, chances for disagreement increase. Where disagreement occurred, parents of boys, especially in the middle level of living, generally had higher expectations than their sons displayed. However, parents' educational expectations for their daughters, especially those in the high level of living group, most often were less than those of their daughters.

Disagreement regarding noncollege plans was likewise seen among parents and youth not anticipating college attendance. More similarity of noncollege plans was found among parents and daughters than among parents and sons (Table 16). Parent-youth disagreement was also more frequent among the low level of living group. This situation complements the case discussed above with regard to disagreement on plans for further schooling among the high level of living parents and youth.

The variation in agreement on parental urging by level of living can be seen in Table 17. Agreement between parents and youth was more common the higher the level of living. Boys reported having received more urging from their mothers than mothers reported having given. The amount of urging girls indicated receiving was equally above and below that reportedly given by their mothers. Fathers usually responded that they had given less urging than their sons and daughters said that they had received from them.

The kinds of occupations that youth desired and expected did not seem to vary greatly by membership, residence, or family size. Only among parents of girls did even level of living rise to an association with occupation. The nature of this relationship can be seen in Table 18 and is exactly what one might expect with the greatest level of living differences being located in preferences for the professional and technical occupations.

Summary and Conclusions

Rural ninth and tenth grade youth, approximately 288 from each of four states located in the Southern Appalachian region, were selected at random and tested as to certain of their attitudes toward an education, their educational and vocational expectations, and their vocational preferences. Both mothers and fathers of the youth were given questionnaires similar to those of the youth and were instructed to respond to them as they hoped their teenager had responded to them at school. The objectives of the study were: (1) to describe similarities and differences in educational goals of rural youth and of their parents for them; and (2) to determine the relationships of the similarities and differences in these goals to such factors as (a) geographic area; (b) state; (c) sex; (d) level of living; (e) farm or nonfarm residence; (f) family size; (g) membership in FFA, FHA, or 4-H Club.

Youth were selected at random to represent an equi-partitioned universe characterized by the following criteria: (1) rural residence; (2) enrollment in ninth and tenth grades of predominantly white county school systems having chapters of Future Farmers of America and/or Future Homemakers of America which were not located within the corporate limits of cities with 50,000 or more population. It was necessary that the selected youth be living with both parents.

As might be expected, the differences between boys and girls in regard to vocational interests, educational attitudes, as well as the degree of similarity to their parents' preferences for them, were predominant. Girls' attitudes toward an education were more favorable and were more similar to those their parents hoped they held than were boys' attitudes. The length of time that boys planned to stay in school, however, was markedly similar to girls' plans. This finding was unexpected in view of the differences that appeared between boys' and girls' evaluations of an education. It may, however, be related to the fact that boys more frequently than girls expected to receive complete or a great deal of financial help for schooling from their parents. It appears that there is a "double standard" in the requirements for education. Girls believe in the value of an education—for their brothers and some-day spouses.

Girls and boys reported considerably more "strong urging" to continue their education from their mothers than from their fathers. Burchinal (5) similarly observed that among rural tenth and twelfth grade boys in Iowa, boys talked over occupational plans with their mothers more frequently than with their fathers. In the present study, girls more often reported receiving encouragement from mothers than did boys. This stronger or more frequent maternal urging was probably responsible, in part at least, for girls' attitudes toward the value of an education.

Boys revealed a greater preference than girls for outdoor, mechanical, computational, scientific, and persuasive type activities. Girls, on the other hand, exhibited higher artistic, literary, social service, musical, and clerical interests than boys. Youth had greater sex role oriented vocational interests than their parents did for them, particularly than those of the parent of the opposite sex. Girls had higher interest than parents desired in female oriented activities such as artistic, literary, musical, and social service activities and less interest in such male related activities as outdoor, mechanical, scientific, and persuasive areas. Boys had higher outdoor, mechanical, and scientific interests and lower computational, literary, social service, musical, and literary interests than mothers and fathers preferred. Parent responses to the vocational preference test were elicited under instructions to answer as the parent *hoped* his or her son or daughter felt. It would seem likely that many of the parents' own preferences were reflected since youths' vocational interests were more similar to the responses of the parent of the same sex.

No differences between members and nonmembers of FFA, FHA, or 4-H Clubs were found in regard to attitudes toward the value of an education, nor with regard to educational or vocational plans. Does this finding imply that affiliation with such organizations has no effects on educational values nor plans? Not when this lack of difference is seen in conjunction with the fact that membership status was associated with certain vocational interests. Members' interest was higher than nonmembers' interest in mechanical and outdoor type activities and lower in clerical, computational, and literary type activities.[9] Thus the interests of members were already in areas which traditionally require lesser amounts of schooling. Their educational values and their plans for further study, however, were not noticeably less than those of nonmembers. Other membership-related differences were in the nature of interactions. The outdoor scores appeared to be in accord with the rural instincts which resonate among nonfarm, member boys but which were surprisingly restrained among girls—even the farm girls who were members. Fairly high outdoor scores were also found among the farm boys who were nonmembers. The nonfarm, nonmember boys had relatively low outdoor scores.

A greater value was placed upon an education by youth from a high or middle level of living background rather than those from a low level of living background. Youths' educational expectations increased in relation to level of living background; a college diploma was envisioned almost twice as frequently by boys and girls from a high level of living background as among middle level of living youth, and four times as frequently as among youth from a low level of living background. Youth from a high level of living background reported

[9] The findings reported here reinforce those of a similar study in North Carolina by Price (29). She found that except in the mechanical and social service areas, no significant differences were observable in the vocational preferences of members and nonmembers of Future Homemakers of America or in their attitudes toward the value of an education. Members had greater vocational interest in mechanical and social service areas than nonmembers.

having received more parental urging to continue their education than did other youth which could have accounted, in part, for their higher expectations and more favorable attitudes toward an education. Those results were not unexpected but their magnitude was still impressive.

A "lack of finances" has been found to be a frequent answer given by rural youth when asked why they did not attend college. Christiansen (7) has noted that despite the lack of relationship between reported family income and college plans, a relationship existed between rural youths' perception of their families' relative economic position and their plans for college. A perception of "above average" family income was associated with college plans. In the present study the amount of financial help for schooling that boys and girls expected to receive was seen to increase according to level of living background. The majority of all youth expected some financial help from their family. Sharp differences were noted, however, between the three level of living groups with respect to complete help, a great deal of help, and some help expected. Boys and girls from the high level of living group most frequently expected complete help whereas youth from middle and low level of living backgrounds usually expected some help. Youth from middle and particularly low level of living backgrounds when reporting lack of college plans may have been realistically appraising the financial resources that would be available to them.

The state of agreement between parents' and youths' expectations for further schooling was not too encouraging. About 57 percent of the parent-youth cases were in agreement. The direction of the disagreement varied and disagreement between youth and parents was more pronounced the higher the level of living. Sectors of frequent disagreement were higher level of living girls and their mothers, with girls reporting considerably greater educational expectations than their mothers reported. Youth-parent disagreement regarding non-college plans was more frequent among low level of living families.

Youth from high and middle level of living backgrounds displayed more scientific and musical interest than youth from the low level of living group. This scientific interest is explainable in that certain cultural advantages, generally more prevalent among upper and middle level of living groups, are known to stimulate an interest in discovering new facts and solving problems. Likewise, there may be greater emphasis and resources expended on musical interests among higher level of living families.

Residence, whether farm or nonfarm, was seldom associated with similarities or differences between rural youths' educational attitudes and plans, their vocational interests, and those that their parents hoped they held. Differences in the value youth placed upon an education according to residence were evident. Nonfarm youth placed a higher value on an education than did farm youth. That this residence difference was virtually absent among girls substantiates other studies in which residence differences have occurred for boys but not for girls

(1, 2, 11, 13). This occurrence has been explained as being related to the secondary importance girls attach to employment.

Farm and nonfarm residence were associated with differences in vocational interests. As was the case with educational attitudes, the residence differential was not always present for girls. Artistic-related activities held less interest for farm youth than for nonfarm youth. Little association with art as a medium or as a profession on the part of most farm youth could account for farm-nonfarm differences. A preference for scientific activities was significantly lower among farm than among nonfarm youth. This observation would seem to support similar studies which have shown less inquisitiveness among farm youth than among nonfarm youth.

The degree of similarity between rural youths' educational and vocational plans and their parents' preferences for them showed no relationship to size of family. A small-family background, that is, two or fewer children, was associated with youths' more favorable attitudes toward the value of an education. Parents with several children are doubtless aware of the crucial apportionment of family resources for schooling and consequently are more likely to communicate to youth less anxiety about their education than other parents. It is surprising, however, that this did not show up in differing educational plans.

The artistic interest exhibited by rural youth from families with three or more children was significantly greater than that shown by youth from smaller families. This difference, however, was confined to the farm group. Differences seen here may be accountable in that leisure time for the development of creative interests is more available in larger farm families in which there are a number of family members to share the farm responsibilities.

Data from this study lend support to the current concern over the economically deprived in that it appears that many of rural youths' educational and occupational expectations and those their parents hold for them are closely related to the family's level of living status.

Appendix A

INSTRUMENTS

Three questionnaires were administered to the youth and to their mothers and to their fathers. Parents, interviewed after the youth, were given questionnaires corresponding to those given their teenagers and were asked to answer them as they hoped their sons or daughters answered them at school. The schedules used in the study included: the Hieronymous questionnaire, Attitudes Toward Education (21); a vocational questionnaire developed for the study by the Technical Committee; and the *Kuder Preference Record, Vocational Form* (25).

The Attitudes Toward Education scale elicited information about attitudes and opinions regarding the value of an education as well as a consideration of situations in life which reflected the value placed on education. The vocational questionnaire concerned expectations with respect to educational and vocational plans beyond high school and anticipated financial help with these plans. The *Kuder Preference Record* was designed to measure ten areas of vocational interest; outdoor, mechanical, scientific, persuasive, artistic, computational, literary, musical, social service, and clerical.

Parents also completed an information sheet relating to such data as: number of years of school attended, subject matter studied, past and present occupations.

The education of parents of the students represented a grade range of 0-19 years of schooling. In each state a median grade range of 8-10 was observed for both fathers and mothers of boys and of girls.

Appendix B

The following questionnaire is an example of the type administered to boys and to their parents. Changes occurring on the girls' questionnaire are noted. Parents of boys questionnaire was identical to that of boys and parents of girls questionnaire duplicated that of the girls. Parents were asked, for example, "How far do you expect your son (daughter) to go in school?"

STUDENT VOCATIONAL QUESTIONNAIRE FOR BOYS

INSTRUCTIONS: Read each question carefully. Then answer it according to the instructions given with the question itself.

1. How far do you expect to go in school? (check one)
   - _____ This will probably be my last year
   - _____ Another year or two
   - _____ I intend to finish high school
   - _____ I expect to start to college but probably won't finish
   - _____ I expect to graduate from a four year college
   - _____ I expect to continue professional study after college graduation

2. How many years do you expect to take courses in these subject in high school?

	How many more years will you take?	Check the ones you consider to be important for your future
Agriculture	_____	_____
Biology	_____	_____
Chemistry and physics	_____	_____
Commercial course (such as typing or bookkeeping)	_____	_____
English	_____	_____
Foreign language	_____	_____
Home economics	_____	_____
Industrial training	_____	_____
Mathematics	_____	_____
Social science (such as history, government, economics)	_____	_____

PLANS BEYOND HIGH SCHOOL

3. If you are not planning to attend college, what are your plans? Check the statement below that best fits your plans.

_____ Take training courses before working (such as, trades school, business college, evening vocational classes at high school, correspondence courses)
_____ Take apprentice or on the job training for skilled labor work
_____ Go to work immediately, without further job training
_____ Help my father in his occupation, farm, or business
_____ Get the military service requirement out of the way before further planning
_____ Undecided

(Girls)
If you are not planning to attend college, what are your plans? Check the statement below that best fits your plans.

_____ Take training courses before working (such as beauty school, business college, practical nursing school, evening vocational classes at high school, correspondence courses)
_____ Take apprentice or on the job training, such as for nursing aide, receptionist, etc.
_____ Go to work immediately without further job training
_____ Marriage as soon as I leave school
_____ Help my family at home
_____ Undecided

4. If you are planning to attend college, answer these questions:

a. What college will you attend? _____
(name of college)

b. What courses of study do you plan to follow in college?

_____ Agriculture
_____ Commerce
_____ Dentistry
_____ Education
_____ Engineering
_____ Fine Arts
_____ Home Economics
_____ Law
_____ Liberal Arts (social science, language, etc.)
_____ Nursing
_____ Pharmacy
_____ Physical or Biological Science
_____ Pre-Medicine
_____ Religion
_____ Veterinary Medicine

c. If you plan to enroll in agriculture, which area interests you most?

_____ Agriculture Education
_____ Agricultural Economics
_____ Agricultural Engineering
_____ Agronomy
_____ Animal and Poultry Science
_____ Dairy Processing
_____ Food Technology
_____ General Agriculture
_____ Horticulture
_____ Entomology and Plant Pathology
_____ Landscape Architecture
_____ Rural Sociology
_____ Forestry
_____ Veterinary Medicine

(Girls)
If you plan to enroll in Home Economics, which area interests you most? (check one)

_____ Child development and family relations
_____ Clothing and textiles
_____ General home economics
_____ Home economics education
_____ Foods and nutrition
_____ Interior decoration and design
_____ Home management and housing

5. As to continuing my education beyond high school, my father:
_____ has strongly urged me to continue
_____ has given me some encouragement to continue
_____ has never said much about it
_____ feels that I would be better off going to work after high school
_____ feels that I should quit high school and go to work

6. As to continuing my education beyond high school, my mother:
_____ has strongly urged me to continue
_____ has given me some encouragement to continue
_____ has never said much about it
_____ feels that I would be better off going to work after high school
_____ feels that I should quit high school and go to work

7. As to any further help from my folks in getting a start or in continuing schooling after high school, my parents would be:
_____ willing to pay my way completely
_____ financially able to help me a great deal
_____ financially able to give me some help
_____ financially able to give me no help
_____ would need financial support from me if I went to college

8. The occupations I would most like are:
1. _____ 2. _____
3. _____ 4. _____

9. What do you actually expect you will be doing as a lifetime kind of work? (Be specific as to what occupation you actually plan to follow.)

10. What do your parents think of your present occupational plans? (check one)
_____ Think I am shooting too high
_____ Think it's a good occupation and I have a chance of making it
_____ Think I should be trying for something different
_____ They say it's entirely up to me to get what I want
_____ I have never discussed it with them

(Girls)
My father's opinion is that:
_____ girls should expect to marry rather than prepare for a career
_____ a girl needs little preparation for an occupation because she will work, at most, only a few years before marrying
_____ a girl today should be prepared for both a career and marriage

_____ marriage and homemaking are not a full time occupation for women except when the children are small
_____ a girl needs preparation for a career, but not for marriage

My mother's opinion is that:
_____ girls should expect to marry rather than prepare for a career
_____ a girl needs little preparation for an occupation because she will work, at most, only a few years before marrying
_____ a girl today should be prepared for both a career and marriage
_____ marriage and homemaking are not a full time occupation for women except when the children are small
_____ a girl needs preparation for a career, but not for marriage

11. In getting a start in the occupation I have chosen, my parents:
_____ will give me all the financial help I need
_____ will give me most of the financial help I need
_____ will give me some of the financial help I need
_____ will give me very little financial help
_____ will give me no financial help at all

12. Two lists of occupations follow. One lists occupations in agriculture and one lists occupations in other areas. For each list, indicate your three choices as preferred occupations and your familiarity with each of the nine occupations.

OTHER AREAS

Check the three occupations you most prefer	Check how familiar you are with the work involved in this occupation. I know a lot about it	I know something about it	I know very little about it

*VOCATIONAL AGRICULTURE, EDUCATIONAL FACILITIES, *ORNAMENTAL HORTICULTURE, *FLORICULTURE, *TURF MANAGEMENT, *CURRICULUM, SCHOOL SURVEYS,

Delaware,

In order to determine what teaching units were included in the state's vocational agriculture programs and the facilities available to aid instruction in these areas, 18 high schools in Delaware were surveyed. In 11 schools the vocational agriculture departments were including ornamental horticulture, seven were including floriculture, and 10 were including turf units. Greenhouse facilities were available in three schools, three had propagation areas, one had cold frames, and none had nurseries. Inclusion of these three subject areas and use of additional facilities was recommended to vocational agriculture teachers. (JM)

A Survey of Departments of Vocational Agriculture in Delaware to Ascertain the Emphasis Being Given to the Areas of Ornamental Horticulture, Floriculture, and Turf in the Course of Study and the Physical Facilities Available

(Study made in Winter of 1963-64)

Ralph P. Barwick

Introduction

In recent years the areas of ornamental horticulture, floriculture, and turf have grown considerably in their importance in the State of Delaware. This increase in importance is due to the rapid population increase (40.3 per cent during the most recent census decade), increased consumer incomes (over $3,100 per capita in 1962 and the highest of any state in the U. S.), and new home construction primarily in the suburban areas.

There has been a tremendous increase in nursery crops in Delaware, particularly ornamentals. Table I shows that nursery acreage increased by 127 per cent from 1950 to 1961. Garden centers and other retail outlets have been established in great numbers to serve the needs of the consumers from the nearby housing developments. The most significant increase in sales of nursery stock took place in New Castle County where there was a

Table I

Acreage of Certified Nurseries, and Total Sales of Nursery and Greenhouse Products, Delaware, 1950-61*

Year	Nursery Acreage State	Total Sales			
		State	New Castle County	Kent County	Sussex County
		Dollars			
1950	1,113	1,872,311	739,161	101,243	1,031,905
1954	1,866	2,804,426	1,187,106	77,360	1,539,960
1959	1,869	3,059,293	1,826,376	91,448	1,141,469
1961	2,536	N.A.	N.A.	N.A.	N.A.

* Source: U.S. Census of Agriculture, 1950, 1954, 1959
Nursery Acreage, 1961 - Del. Dept. of Plant Industry

147 per cent increase from 1950 to 1959. During this same period there was an increase of 63 per cent for the State as a whole. This trend certainly indicates a bright future for ornamental crops in Delaware.

Purpose of the Study

The data included in the introduction of this study would certainly indicate the possibility of positions being available to individuals who have had the proper training in the areas of ornamental horticulture, floriculture, and turf. Training of this nature could be made available to those enrolled in vocational agriculture in the schools of Delaware by including teaching units in the course of study covering these horticultural areas.

In order to determine the extent that teaching units in the areas of ornamental horticulture, floriculture, and turf where included in the course of study of each vocational agriculture department in Delaware, and the physical facilities that were available to aid in the instruction of these areas, a survey was made during the winter of 1963-64. Specifically, the survey attempted to secure the following information:

1. Per cent of departments of vocational agriculture that include teaching units in ornamental horticulture in the course of study.

2. Per cent of departments of vocational agriculture that include teaching units in floriculture in the course of study.

3. Per cent of departments of vocational agriculture that include teaching units in turf in the course of study.

4. Mean and range of number of periods allotted by the departments of vocational agriculture in the course of study for ornamental horticulture.

5. Mean and range of number of periods allotted by the departments of vocational agriculture in the course of study for floriculture.

6. Mean and range of number of periods allotted by the departments of vocational agriculture in the course of study for turf.

7. Distribution of the number of periods allotted to ornamental horticulture by grade level.

8. Distribution of the number of periods allotted to floriculture by grade level.

9. Distribution of the number of periods allotted to turf by grade level.

10. Total number of periods allotted to the areas of ornamental horticulture, floriculture, and turf in each department of vocational agriculture including one, two, or three of the areas in the course of study.

11. Per cent of vocational agriculture departments with own greenhouse.

12. Per cent of vocational agriculture departments sharing greenhouse with another department in the school.

13. Departments with whom greenhouses are shared.

14. Size of greenhouses as measured by number of square feet.

15. Types of greenhouse construction.

16. Methods of greenhouse ventilation and heating.

17. Number of greenhouses with propagation equipment.

18. Per cent of vocational agriculture departments with a propagation area available eventhough department has no greenhouse.

19. Locations of propagation areas when not in greenhouse.

20. Per cent of vocational agriculture departments with cold frames.

21. Per cent of vocational agriculture departments operating a school nursery for ornamental plants.

22. Number of acres in school nurseries.

23. Per cent of vocational agriculture departments with land available for a school nursery.

24. Number of acres available for school nurseries.

Procedure

A survey form was distributed to the teachers of vocational agriculture in each of the 18 high schools early in the winter of 1963-64. One hundred per cent return of the survey forms was obtained.

Report of the Study

The number and per cent of the vocational agriculture departments in Delaware that included teaching units in their course of study on ornamental horticulture, floriculture, and turf is reported in Table II. Table II also includes the mean number of periods and the range in number of periods for each of the three areas.

Table II

The Extent to Which Eighteen Departments of Vocational Agriculture in Delaware High Schools Include Teaching Units in the Areas of Ornamental Horticulture, Floriculture, and Turf in the Course of Study

Teaching Unit	Number of Depts.	Per Cent of Depts.	Mean Number of Periods	Range in Number of Periods
Ornamental Horticulture	11	61	16	5 - 50
Floriculture	7	39	12	3 - 25
Turf	10	55	8	4 - 20

Sixty-one per cent of the vocational agriculture departments in Delaware included ornamental horticulture units in the course of study, 39 per cent included floriculture, and 55 per cent included turf. The mean number of periods allotted to ornamental horticulture was 16, with the range being from five to 50. Twelve was the mean number of periods for floriculture, with a range from three to 25, and the mean number of periods for turf was eight, with a range from four to 20.

Distribution of the number of periods allotted to ornamental horticulture by grade level in the 11 departments of vocational agriculture including it in the course of study is reported in Table III.

Table III

Distribution of the Number of Periods Allotted to Ornamental Horticulture by Grade Level in the Eleven Departments of Vocational Agriculture Including It in the Course of Study

Department*	Number of Periods in

R	6		4	10

* Each department was assigned a letter of the alphabet rather than publish the name of the department. However, once a letter was assigned to a department it is used to designate that department throughout this paper.

Table VI shows that 12 departments of vocational agriculture out of a possible 18, or 66 2/3 per cent, are allotting some time in their course of study to one or more of the areas covered in this survey.

Physical Facilities

Two, or 11 per cent, of the 18 vocational agriculture departments in Delaware have their own greenhouse and one, or five and one-half per cent, shares a greenhouse with the science department in their school. Thus 16 1/2 per cent of the departments do have greenhouse facilities available.

One greenhouse covers 1,250 square feet (25' x 50'), the other covers 252 square feet (12' x 21'),and the shared greenhouse covers 420 square feet (14' x 30').

Two of the greenhouses are of the conventional type using metal and glass, and one is of the lean-to type using metal and glass. Two of the greenhouses are equipped with automatic ventilation and one has to be manually controlled. Fans are included in the ventilation system of one, but not in the other two. One greenhouse has hot air heat, the other has hot water heat, and the method of heating the third was not reported. Two of the three have mist propagation equipment.

Three, or 17 per cent, of the departments that do not have greenhouses, do have a propagation area available to them somewhere within the school plant or on the school grounds. One of the departments that has a greenhouse, also has another propagation area available to them. One, or five and one-half per cent, of the departments has a cold frame.

At the time of this survey there were no departments of vocational agriculture in Delaware operating a school nursery for ornamental plants. One department reported that they were planning to start a five-acre nursery in the spring of 1964.

Twenty-two per cent, or four, of the departments have land

available for a school nursery. The acreage available to these four departments is as follows: 1.67 acres, 2.5 acres, 5 acres, and 26 acres.

Summary and Conclusions

Sixty-one per cent of the vocational agriculture departments in Delaware at the time of this survey were including some ornamental horticulture units in their course of study, 39 per cent were including floriculture, and 55 per cent were including turf. Out of a possible 18 departments, 12, or 66 2/3 per cent, are allotting some time in their course of study to one or more of the areas of ornamental horticulture, floriculture, and turf.

Sixteen and one-half per cent have greenhouse facilities available and five and one-half per cent have cold frames.

No departments of vocational agriculture in the State were operating school nurseries at the time of this survey, but 22 per cent have land available for one.

Teachers of vocational agriculture in the State of Delaware should be aware of the importance of ornamental horticulture, floriculture, and turf in their State and community and allot a proportionate amount of time in the course of study to these areas of subject matter. The percentage of those that are including these areas in their course of study indicates that most are cognizant of the situation. However, this survey indicates that much needs to be done to improve the availability of physical facilities to increase the effectiveness of the instruction.

*VOCATIONAL AGRICULTURE, *HIGH SCHOOL STUDENTS, GRADE 12, *COLLEGE ADMISSION, *ADMISSION CRITERIA, *COLLEGE PREPARATION,

Delaware,

In the spring of 1963 survey forms were sent to vocational agriculture teachers and principals in 15 high schools and all responded. In 13 schools it was possible for vocational agriculture students to schedule the academic courses required for admission to the B.S. degree curriculum of the School of Agriculture at the University of Delaware. Of the 92 high school seniors enrolled in vocational agriculture, 22 had applied for admission to college and 15 had applied for admission to either the B.S. or Associate degree curriculum in the School of Agriculture at the University of Delaware. It was recommended that the vocational agriculture student who is academically capable should complete the academic courses required for admission to most colleges. (PS)

Ag. Ed. Publication No. 1

A Survey of Departments of Vocational Agriculture Having F. F. A. Chapters in Delaware to Ascertain the Extent Vocational Agriculture High School Graduates Can Meet the Entrance Requirements of the School of Agriculture at the University of Delaware

(Study made in Spring of 1963)

Ralph P. Barwick

The primary objective of vocational education in agriculture has been recognized as preparation for a career in farming or for off-farm agricultural occupations in which a broad knowledge of production agriculture and rural life is essential. Each year the entry into such careers upon high school graduation is becoming more difficult. More and more will the young man need to supplement his high school training with additional education. With this in mind, it is good insurance for capable young men to have completed at the time of high school graduation the courses required for entrance into an institution of higher learning.

It is logical that many of the young men who have completed the vocational agriculture course in high school should want to enroll in the agriculture curriculum in college since they are interested in agriculture, have participated in agricultural experience programs, and appreciate the science of agriculture. Also, it should logically follow that these vocational agriculture graduates of Delaware high schools would choose the University of Delaware for their training.

Current admission requirements for the Bachelor of Science degree in the School of Agriculture at the University of Delaware are as follows:

4 units (years) of English
1 unit (year) of Algebra
1 unit (year) of Plane Geometry
1 unit (year) of History
1 unit (year) of Laboratory Science
7 units of Approved Electives
15 units

The above requirements do not apply to the Associate in Applied Science degree (agriculture). The entrance requirements for this degree are:

4 units (years) of English
High School Graduate

Purpose of the Study

In order to determine the extent graduates of the 15 departments of vocational agriculture with F. F. A. Chapters in the state were meeting course entrance requirements for the B. S. degree in the School of Agriculture at the University of Delaware, a survey was made in the spring of 1963. Specifically, the survey attempted to secure the following information:

1. Per cent of schools in which vocational agriculture students could schedule the necessary academic courses required for admission to the B. S. degree curriculum of the School of Agriculture at the University of Delaware without difficulty or without making "special arrangements."

2. Per cent of schools in which vocational agriculture students could schedule the necessary academic courses required for admission to the B. S. degree curriculum of the School of Agriculture at the University of Delaware with some difficulty or without making "special arrangements."

3. Per cent of schools not permitting the scheduling of necessary academic subjects by vocational agriculture students for admission to the B. S. degree curriculum of the School of Agriculture at the University of Delaware.

4. Number of senior boys enrolled in vocational agriculture.

5. Per cent of senior boys enrolled in vocational agriculture meeting entrance requirements for the B. S. degree in the School of Agriculture at the University of Delaware at the time of graduation.

6. Per cent of senior boys enrolled in vocational agriculture who rank in the upper one-half of their high school graduating class.

7. Per cent of senior boys in vocational agriculture who have applied for admission to the B. S. curriculum in agriculture at the University of Delaware.

8. Per cent of senior boys in vocational agriculture who have applied for admission to the Associate degree curriculum in agriculture at the University of Delaware.

9. Per cent of senior boys in vocational agriculture who have applied for admission to an agricultural curriculum at a college or university other than the University of Delaware.

10. Per cent of senior boys in vocational agriculture who have applied for admission to a curriculum other than agriculture at the University of Delaware.

Procedure

A survey form was distributed to the teachers of vocational agriculture and the high school principals in each of the 15 high schools late in the spring of 1963. One hundred per cent return of the survey forms was obtained.

Report of the Study

The situation in Delaware regarding the degree to which high school graduates of vocational agriculture could meet the entrance requirements of the B. S. degree curriculum of the School of Agriculture at the University of Delaware is reported in Table I.

Table I

The Extent to Which 15 Delaware High Schools Provide Opportunity for Vocational Agriculture Students to Schedule the Necessary Academic Courses to Meet Entrance Requirements of the B. S. Degree Curriculum of the School of Agriculture at the University of Delaware

Extent to Which Needed Academic Courses Could be Scheduled Along with Vo-Ag	Number of Departments	Per Cent
Possible - no problem	11	74
Possible - with "special arrangements" or some difficulty	2	13
Not Possible	2	13
	15	100

Seventy-four per cent of the high schools in Delaware that have vocational agriculture in their curriculum and sponsor a chapter of the F. F. A. permit vocational agriculture students to schedule the necessary academic courses needed for admission to the B. S. degree curriculum of the School of Agriculture at the University of Delaware. Thirteen per cent of the schools in which agriculture was offered could provide vocational agriculture students an opportunity to schedule the needed academic courses with some special arrangements. Another 13 per cent reported that vocational agriculture students, for various reasons, could not enroll in the necessary academic courses.

High School Seniors Enrolled in Vocational Agriculture Who Were Interested in College

There were 92 high school seniors enrolled in vocational agriculture in Delaware during the 1962-63 school year. Thirty-six, or 30 per cent, were completing or had completed the academic courses required for entrance to the B. S. degree curriculum in the School of Agriculture. Of the 92 seniors, 28, or 30 per cent, ranked in the upper one-half of their high school graduating classes.

The survey showed that 22 seniors enrolled in vocational agriculture had applied for admission to institutions of higher learning. It is not known how many seniors were accepted and are now enrolled in college, however, approximately 24 per cent of the 92 seniors had applied for college admission. Nationwide approximately 30 per cent of all high school graduates obtain some college training.

Of this group of 22 seniors that had applied for admission to institutions of higher learning, 8, or 36 per cent, had applied for admission to the B. S. degree curriculum in agriculture at the University of Delaware. Seven, or approximately 32 per cent, had applied for admission to the Associate in Applied Science (agriculture) degree at the University of Delaware. This shows that of the 22 seniors planning to further their education at the collegiate level, 15, or 68 per cent, had made application to the School of Agriculture at the University of Delaware.

Of the remaining seven, four, or 18 per cent, had applied for admission to an agricultural curriculum at a college or university other than the University of Delaware and three, or 14 per cent, had applied for admission to a curriculum other than agriculture at a college or university other than the University of Delaware. None had applied for admission to a curriculum other than agriculture at the University of Delaware.

Summary and Conclusions

It was possible for vocational agriculture students to schedule the academic courses required for admission to the B. S. curriculum of the School of Agriculture at the University of Delaware in 87 per cent of the schools.

Approximately 24 per cent of the high school seniors enrolled in vocational agriculture had applied for admission to college and 68 per cent of these had applied to either the B. S. or Associate degree curriculum in the School of Agriculture at the University of Delaware.

It is recommended that the vocational agriculture student who is academically capable complete the academic courses required for admission to most colleges. While in high school a young man's goal may be strongly pointed toward an agricultural occupation in which he believes a college education is not necessary, but as he progresses through school this goal might change. He may see college attendance as necessary additional training to reach this new goal. Teachers and guidance personnel should be particularly alert concerning such students and should counsel with them as intelligently as possible.

The author is indebted to Dr. David R. McClay, Head, Department of Agricultural Education, The Pennsylvania State University, for many of the ideas and the format used in this study.

FARMERS, OFF FARM AGRICULTURAL OCCUPATIONS, *PROGRAM EVALUATION, *VOCATIONAL AGRICULTURE, LEADERSHIP TRAINING, HIGH SCHOOL GRADUATES, SUPERVISED FARM PRACTICE, *VOCATIONAL FOLLOWUP, COLLEGE ATTENDANCE, PARENTAL BACKGROUND, *OCCUPATIONAL CHOICE,

Texas, Future Farmers of America, FFA Degree,

Questionnaires were sent to 1,201 of the 1,540 graduates from a representative sample of 52 of the 89 high schools in the area who had completed one or more years in vocational agriculture and who graduated in 1953, 1954, and 1955 to determine (1) their current occupation, (2) factors related to their occupational choice, (3) whether they had attended college, (4) their evaluation of course areas, (5) their evaluation of subject matter areas, and (6) their evaluation of vocational agriculture and Future Farmers of America (FFA) activities. Of the 846 who responded, 28.4 percent were farm operators, 15.7 percent were employed in farm-related occupations, 49.5 percent had entered nonagricultural employment, and 6.4 percent were in military service. Over 56 percent of the graduates whose fathers were farm operators entered agricultural occupations, compared with 18.9 percent whose fathers were in nonagricultural occupations. A graduate was more likely to become a farm operator as the number of years he had studied vocational agriculture increased. Approximately three-fifths had attended college and one-half of these had received a degree. Of the farm operators, 40 percent wished they could have substituted management or agri-business experience for supervised farm programs in high school. FFA leadership training was rated high by those in agricultural fields. (MS)

INTRODUCTION

High school curricula should be constantly evaluated to assist school personnel in developing courses according to the needs of the students. It is a known fact that technological innovations have caused job obsolescence while creating new job opportunities. This fact is true in vocational agriculture as well as in other areas. Consequently, information is needed to determine if present programs are being improved, and new courses are being added, to prepare students for the jobs available.

In agriculture, both advances in technology and changes in the organizational structure have provided incentive to increase the size of farms, thereby decreasing the number of farmers required to produce the food and fiber for our nation. Simultaneously, there is an increasing demand for employees with training in agriculture who understand the problems associated with distribution, processing, packaging, and marketing agricultural products.

To meet these demands, new programs are needed, and it is believed that the first step in such a development is to evaluate the students' vocational agriculture training with respect to their occupations. This particular study was developed for this purpose. It was designed to determine (1) the graduates' occupation, (2) factors related to occupational choices, (3) college attendance, (4) evaluation of high school course areas, (5) evaluation of vocational agriculture subject matter units, and (6) evaluation of vocational agriculture and Future Farmers of America (FFA) activities. The findings determined from this study should be especially beneficial to the teachers in Vocational Agriculture Area I of Texas, since the last follow-up study of graduates in this area

was conducted in 1939.

The objectives of this study were as follows:

1. To determine the present occupational status of West Texas high school graduates of 1953, 1954 and 1955, who had completed one or more years of vocational agriculture.
2. To determine the factors related to occupational choices of graduates.
3. To evaluate the high school course areas as related to occupations of the graduates.
4. To evaluate the vocational agriculture program as related to occupations of the graduates.
5. To determine possible changes that could be made in vocational agriculture in order to fulfill the needs of male high school graduates in West Texas.

METHOD OF PROCEDURE

A questionnaire was designed to obtain the information concerning the high school graduates' occupations and how they evaluated their vocational agriculture training. The years of vocational agriculture completed and the scholastic rank of the graduates were obtained from the high school permanent records.

The questionnaires were mailed to the high school graduates who had completed one or more years of vocational agriculture and who were graduated in 1953, 1954, or 1955. This period was selected as it allowed the graduates sufficient time to complete college, return from the military services, and become established in an occupation.

To obtain a representative sample, 52 high schools were selected from the 89 high schools in Vocational Agriculture Area I that had a vocational agriculture department during the 1953-1955 period. Area I consists of 38 counties that include the Panhandle of Texas. The high schools were divided into the following three groups according to the mean high school enrollments for the 1953-1955 periods: (1) below 130 enrollment, (2) 130 to 250 enrollment, and (3) above 250 enrollment. To obtain an equal number of graduates from the three groups, a random sample of 24 high schools was selected from the smaller sized schools, 17 from the medium sized schools, and 11 from the larger sized schools. Sufficient addresses of the graduates were secured from 45 of the 52 high schools.

The cooperation and hard work of the administrators and vocational agriculture teachers of the following high schools made this study possible:

Amherst	Groom	Quail
Anton	Gruver	Ralls
Booker	Hart	Ropes
Bovina	Hereford	Silverton
Childress	Idalou	Smyer
Claude	Kress	Spearman
Cooper	Levelland	Springlake
Crosbyton	Littlefield	Spur
Dalhart	Lubbock	Stratford
Darrouzette	Matador	Sundown
Dimmitt	Muleshoe	Texline
Estelline	Pampa	Three Way
Farwell	Panhandle	Tulia
Floydada	Patton Springs	Vega
Friona	Plainview	Whiteface

A total of 1540 graduates from the 45 high schools completed one or years of vocational agriculture and were graduated in 1953, 1954, and 1955. Eighteen individuals of this group were deceased at the time of the study. The vocational agriculture teachers obtained the addresses of 1201 graduates, or 78.9 percent of the total living graduates. The questionnaire was pretested by mailing it to 20 graduates who had received some vocational agriculture training in a high school that was not included in the random sample of schools. The revised questionnaire, a cover letter that explained the importance of the research, and a return envelope were mailed to the 1201 graduates. Fifty-two percent (625) of the graduates returned the questionnaire within ten days. Those who did not return the questionnaire were mailed another questionnaire and cover letter. Nineteen and seven-tenths percent (236) of the graduates complied by returning the questionnaire on the follow-up mailing. Fifteen of the 861 questionnaires returned were incomplete and were not used. The 846 questionnaires used represented 70.4 percent of the graduates whose addresses had been obtained and 55.6 percent of the total graduates.

The answers to the questions on the questionnaires were coded and punched on International Business Machine (I.B.M.) cards. This procedure

501 69

facilitated the sorting and tabulation of the data.

Vocational Agriculture Area I was selected for this study for the following reasons: (1) the study could be coordinated with one vocational agriculture supervisor, (2) travel by the author would be limited since the schools were relatively close to Texas Technological College, and (3) the area would be easily defined if similar studies were conducted in the future. It should be emphasized that this area was not representative of all counties in Texas as to type of agriculture and cash farm income. The agriculture in this area consisted mainly of beef cattle, cotton, grain sorghum, and wheat, with considerable acreage under irrigation. The estimated cash farm income per farm in this 38-county area in 1960 was $28,675, compared to an estimated cash farm income per farm of $9,730 for the 254 counties in Texas. These estimates of cash farm income were compiled by the Bureau of Business Research, College of Business Administration, University of Texas.

The following terms were defined as follows to aid in interpreting the data:

1. Graduates: Former high school graduates who had completed one or more years of vocational agriculture.
2. Farm operator: A graduate who spent 50 percent of his time on a farm and who received 50 percent or more of his income from farming. He had to own and/or rent land to be classified as a farm operator.
3. Farm-related occupation: An occupation for which the worker needs to have experience in farming and/or a knowledge of the why and the how of farming operations or one in which he is most effective in his work if he has them. This group included those who were farm managers and farm laborers.

4. Nonagriculture occupation: An occupation for which the worker does not need to have experience in farming or a knowledge of the why and how of farming operations.

5. Vocational Agriculture Area I: A 38-county area that includes the Panhandle of Texas. The counties furthest South are as follows: Cochran, Hockley, Lubbock, Crosby, Dickens, and King.

6. Mean value rating: Determined by coding the value of "very important" as 4, "important" as 3, "little importance" as 2, and "no value" as 1.

FINDINGS

General Characteristics

Occupations of graduates

As indicated by data in Table 1, 240 graduates, or 28.4 percent, were farm operators; 133, or 15.7 percent, were employed in farm-related occupations; 419, or 49.5 percent, had entered nonagricultural occupations; and 54, or 6.4 percent, were in the military services. In comparison, 62.7 percent of the graduates' fathers were farm operators, 7.8 percent were in farm-related occupations, and 28.1 percent were in nonagricultural occupations.

The respondents who were college graduates at the time of this study were placed into occupational groups according to their college major. The seven college students majoring in agriculture were placed in the farm-related occupational group and the 19 college students who were nonagricultural majors were placed in the nonagricultural occupation group.

When those individuals employed in farm-related occupations were stratified by job category, data in Table 2 show that no category represented a high percentage of the total 846 graduates. Farm-related service occupations comprised 3.7 percent, operation and management occupations, 3.4 percent, and agricultural professions, 3.2 percent of the total graduates.

These data indicate that revising vocational agriculture to meet the needs of those individuals in any specific job category would be difficult. However, a vocational agriculture teacher should develop a teaching unit on the job opportunities available to graduates in farm-related occupations.

Table 1. Occupation of graduate compared to that of father

Occupation	Son		Father	
	N	%	N	%
Farm operator	240	28.4	530	62.7
Farm related	133	15.7	66	7.8
Nonagricultural	419	49.5	238	28.1
Military	54	6.4	-	-
Deceased	-	-	12	1.4
Total	846	100.0	846	100.0

Table 2. Job categories of graduates employed in farm-related occupations

Job category	Number	Percentage of total graduates (846)
Services	31	3.7
Operation or management	29	3.4
Agricultural profession	27	3.2
Selling	17	2.0
Farm laborer	15	1.8
Farm manager	7	0.8
College student majoring in agriculture	7	0.8
Total	133	15.7

One hundred and eight individuals, or 12.8 percent, started and left farming since graduation from high school. Seventy-eight, or 32.5 percent, of the farm operators held other jobs before becoming established in farming.

Twenty-four of the 133 graduates in farm-related occupations were farming part-time. Forty-one of the 473 graduates in nonagricultural occupations were part-time farmers. When the 41 part-time farmers were added to the 240 farm operators and to the 133 in farm-related occupations, 414, or 48.9 percent, of the total graduates were connected with agriculture. Nineteen graduates who were in a nonagricultural occupation and were not farming part-time were receiving income from investments in farm land.

Land operated by farmers

Those high school graduates who had completed one year of vocational agriculture were operating a median of 405.5 acres; those with two years, 480 acres; those with three years, 520 acres; and those who had completed four years of vocational agriculture, 580 acres.

The median number of acres of land operated by all farmers was 536.5 acres.

Migration

The 54 graduates who were in military service were not considered in the determination of the extent of migration of the graduates, as they had little choice as to where they were to be stationed. Therefore, the total for the nonagricultural group in the study of migration was 419 instead of 473.

Data in Table 3 show that only 4.1 percent (10) of the farm operators were farming more than 100 miles from the high school that they had

Table 3. Extent of migration by occupation of graduates

Migration	Occupation							
	Farm operators		Farm related		Nonagricultural		Total	
	N	%	N	%	N	%	N	%
Inside county	178	74.2	62	46.6	109	26.0	349	44.1
Outside county but within 100 miles	52	21.7	37	27.8	124	29.6	213	26.9
101 to 300 miles	4	1.6	19	14.3	70	16.7	93	11.7
More than 300 miles	6	2.5	15	11.3	116	27.7	137	17.3
Total	240	100.0	133	100.0	419	100.0	792	100.0

attended. Seventy-four and two-tenths percent (178) of the farm operators were farming in the county where they had lived and 21.7 percent (52) were farming outside the county but within 100 miles of the high school attended.

Those graduates who were employed in farm-related occupations migrated further than those who became farm operators. Forty-six and six-tenths percent (62) were employed within the county, 27.8 percent (37) were employed outside the county but within 100 miles, 14.3 percent (19) were employed 101 to 300 miles from high school attended, and 11.3 percent (15) were employed more than 300 miles from high school attended.

The graduates who were employed in nonagricultural occupations migrated further than either of the other two occupational groups. Only 26 percent (109) were employed within the county, and 29.6 percent (124) were employed outside the county but within 100 miles of the high school attended. Forty-four and four-tenths percent (186) of those in nonagricultural occupations were employed more than 100 miles from the high school attended.

The results of this study indicate that the vocational agriculture teacher can continue to develop the course of study in vocational agriculture around the needs within the county or, at most, within an area that has a radius of 100 miles from the place where he is teaching. Only 4.1 percent of the farm operators and 25.6 percent of those in farm-related occupations were working more than 100 miles from the high school attended. Seventy-four and two-tenths percent (178) of the farm operators were farming in the same county.

Factors Related to Occupational Choices of Graduates

Occupation of father

The occupation of the father was related to the occupation selected by the son, as indicated by data in Table 4. Forty and four-tenths percent (214) of the sons of fathers who were farm operators became farm operators, 16 percent (85) entered farm-related occupations, 37.9 percent (201) entered nonagricultural occupations, and 5.7 percent (30) were in the military service. In comparison, only 7.1 percent (17) of the sons of fathers who were in nonagricultural occupations became farm operators, 11.8 percent (28) of the sons were in farm-related occupations, 72.3 percent (172) entered nonagricultural occupations, and 8.8 percent (21) were in the military service. In other words, 18.9 percent (45) of the sons of the fathers who were in nonagricultural occupations entered an agricultural occupation.

Ten and six-tenths percent (7) of the sons of fathers who were in a farm-related occupation became farm operators, 25.8 percent (17) entered farm-related occupations, 59.1 percent (39) entered nonagricultural occupations, and 4.5 percent (3) were in the military service.

Of the 133 graduates employed in farm-related occupations, 63.9 percent (85) had fathers who were farm operators while the graduates were seniors in high school, 12.8 percent (17) had fathers who were employed in farm-related occupations, 21.1 percent (28) had fathers who were employed in nonagricultural occupations, and the fathers of 2.2 percent (3) were deceased.

The occupation of the high school student's father would be a good criterion to use if the vocational agriculture teacher was going to select his students on the basis of those who will eventually become farm operators or who will enter farm-related occupations. Only 7.1

Table 4. Relationship of the occupation of the son to that of the father[a]

Occupation of son	Occupation of father							
	Farm operator		Farm related		Nonagricultural		Deceased[b]	
	N	%	N	%	N	%	N	%
Farm operator	214	40.4	7	10.6	17	7.1	2	16.7
Farm related	85	16.0	17	25.8	28	11.8	3	25.0
Nonagricultural	201	37.9	39	59.1	172	72.3	7	58.3
Military	30	5.7	3	4.5	21	8.8	-	-
Total	530	100.0	66	100.0	238	100.0	12	100.0

[b]Not used in computing chi-square.

percent (17) of the sons of fathers who were in nonagricultural occupations became farm operators, and 11.8 percent (28) of the sons were in farm related occupations.

Total acres of land operated by father

As the size of the father's farm increased, the greater was the tendency for the son to become a farm operator. Only 4.9 percent of the sons of fathers who did not operate any land became farm operators. The percentages of the sons of fathers who operated land and became farm operators were as follows: 1 - 199 acres, 23.4 percent; 200- 499 acres, 30.4 percent; 500 - 999 acres, 43.4 percent; and 1000 acres or more, 46.0 percent.

The number of acres of land farmed by the fathers had little relationship to the tendency of sons to enter farm-related occupations. The percentage of sons who entered farm-related occupations according to the number of acres operated by the fathers were the following: none, 15 percent; 1 - 199 acres, 10.6 percent; 200 - 499 acres, 16.8 percent; 500 - 999 acres, 16.3 percent; and 1000 or more acres, 18 percent.

Years of vocational agriculture

A graduate was more likely to become a farm operator and less likely to enter a nonagricultural occupation as the number of years of vocational agriculture completed increased. Eighteen and six-tenths percent (16) of those graduates who had completed one year of vocational agriculture became farm operators, whereas 20 percent (44) of the graduates who had completed two years, 30.9 percent (105) of those who had completed three years, and 37.5 percent (75) of those who had completed four years of vocational agriculture became farm operators. The percentage of graduates who entered farm-related occupations increased when more than one year of vocational agriculture was completed. However, little diffe-

rence existed between those who completed two, three, or four years of vocational agriculture.

Some students who are entering agricultural occupations are possibly being counseled into other high school courses when they should have remained in vocational agriculture. This statement is based on the fact that 60, or 25 percent, of the 240 graduates who were farm operators had only one or two years of vocational agriculture, and 47, or 35.3 percent of the 133 graduates who had one or two years of vocational agriculture were in farm-related occupations.

Size of high school attended

No significant relationship existed between the size of high school from which an individual was graduated and the occupation entered by the graduate. Thirty-one and one-tenth percent of the graduates from the schools with an enrollment below 130 became farm operators, 30.3 percent from the schools with an enrollment of 130 to 250, and 25.2 percent from the schools with an enrollment above 250 students became farm operators.

Thirteen and seven-tenths percent of the graduates from schools with 250 or above enrollment entered farm related occupations, whereas

15.5 percent in the smaller sized schools and 18.7 percent in the medium sized schools entered these occupations.

As the school size increased, the number of graduates entering nonagricultural occupations increased.

The following observation may explain the fact that the size of the high school from which an individual was graduated did not significantly influence the occupation that he selected. The teachers in the larger high schools are selective in deciding which students should enroll in vocational agriculture, whereas in some smaller high schools vocational agriculture may even be required in order to maintain a department.

Scholastic rank of individual in high school graduating class

Of those who were graduated from high school in the upper and the second grade quartiles, 24.2 and 25.8 percent, respectively, became farm operators; whereas 31 and 31.4 percent of those in the third and the lower quartiles became farm operators. The opposite was true of those graduates entering nonagricultural occupations, as 55.7 percent of those in the second quartile entered these occupations whereas 42.6 percent of those in the third quartile were similarly employed. Approximately 50 percent of those graduates in each the upper and the lower quartiles entered nonagricultural occupations. Eleven and nine-tenths percent of the graduates in the second quartile entered farm-related occupations, whereas 20.6 percent of the graduates in the third quartile entered these occupations. Approximately 15 percent of those graduates in each the upper and the lower quartiles were employed in farm-related occupations.

College attendance

A larger percentage of those who entered farm-related or nonagricultural occupations had attended college than had those who became farm operators.

Forty-four and six-tenths percent of the farm operators had attended college, whereas 68.4 and 67.8 percent of those who entered farm-related or nonagricultural occupations had attended college.

Only 17.1 percent of the farmers were graduated from college, whereas 33.8 percent of those in farm related occupations and 35.3 percent of those in nonagricultural occupations had received a college degree.

Data in Table 5 compare the college majors of the high school graduates to their present occupations. Of the 66 farm operators who had attended one semester or more college but had not received a degree, 45.5 percent (30) had enrolled in college in an agricultural major and 54.5 percent (36) in a nonagricultural major. Forty-one farm operators were graduated from college, of which 70.7 percent (29) had majored in agriculture and 29.3 percent (12) had majored in nonagriculture curricula.

Thirty-seven percent (17) of those individuals in farm-related occupations who had not completed college had enrolled in college in an agricultural major, whereas 63 percent (29) had enrolled in a nonagricultural major. Of those who had graduated, 71.1 percent (32) majored in agriculture, and 28.9 percent (13) had nonagricultural majors.

Some high school graduates who took vocational agriculture while in high school were possibly counseled into selecting a nonagricultural major in college when they were destined to enter an agricultural occupation. Approximately three-fifths of the individuals who were in agricultural occupations and who had had some college training selected a nonagricultural major in college. Of those individuals who were graduated from college and who were in agricultural occupations, 29.1 percent had completed their college training in a nonagricultural major.

Each year more agricultural jobs are available for college graduates

Table 5. College attendance and major in college by occupation of graduates

College attendance	Major	Occupation: Farm operator N	Farm operator %	Farm related N	Farm related %	Nonagricultural N	Nonagricultural %	Total N	Total %
One semester or more college but no degree	Agricultural major	30	45.5	17	37.0	23	15.3	70	26.7
	Nonagricultural major	36	54.5	29	63.0	127	84.7	192	73.3
Total		66	100.0	46	100.0	150	100.0	262	100.0
College graduate	Agricultural major	29	70.7	32	71.1	13	7.6	74	28.9
	Nonagricultural major	12	29.3	13	28.9	157	92.4	182	71.1
Total		41	100.0	45	100.0	170	100.0	256	100.0

than there are graduates to fill these vacancies. The high school graduates who have taken vocational agriculture are the best potential source of college agricultural majors, as numerous research studies have indicated. Consequently, high school personnel should encourage more of those individuals who have had vocational agriculture to major in agriculture in college. Of the 262 individuals in this study who had had some college training but no degree, only 26.7 percent (70) were majoring in agriculture while in college, and only 28.9 percent (74) of the 256 individuals who were graduated from college majored in agriculture.

Evaluation of Course Areas

Data in Figure 1 represent the evaluation of high school course areas by graduates who were farm operators or who were employed in farm-related occupations or in nonagricultural occupations. The mean values computed were secured by coding the evaluation of "very important" as 4, "important" as 3, "little importance" as 2, and "no value" as 1. Those who had not taken a course were excluded from the computation for that course.

The farm operators rated English, speech, and typing lower than did those graduates who were in farm-related or nonagricultural occupations. Farmers rated higher the course areas in foreign language, business and bookkeeping, industrial arts, and vocational agriculture.

Those graduates in farm-related occupations rated the various course areas similarly to the way those in nonagricultural occupations rated them, with the two exceptions of science and vocational agriculture, which those in farm-related occupations rated higher.

The graduates in nonagricultural occupations rated science and vocational agriculture lower than did those who were farm operators or those who were in farm-related occupations. Foreign language, business

Figure 1. Evaluation of high school course areas by occupation of graduate

and bookkeeping, and industrial arts were also rated lower by those in nonagricultural occupations than by those in the other two occupational groups, but their ratings and those of graduates in farm-related occupations differed little.

The 54 graduates who were in the military service were included in the nonagricultural occupation group in all evaluation analyses. No significant relationship existed between those in the military services and those in other nonagricultural occupations in the evaluations of high school course areas or vocational agricultural activities. Also, since one-half of the 54 graduates in the military services had served over four years, they were probably making a career of the military service and would not be obtaining a civilian occupation in the near future.

Mean value ratings by graduates classified by occupations

The ranking and mean value ratings of the course areas by the individuals in the three occupational groups are presented in Table 6. Mathematics was rated highest by the graduates of all three groups. Those graduates who were farm operators rated mathematics with a mean value of 3.73 compared to 3.66 by those in farm-related occupations and 3.57 by those in nonagricultural occupations.

Vocational agriculture was rated second in importance by the farm operators, fourth by those in farm-related occupations, and ninth by those in nonagricultural occupations. The mean value of 2.32 indicates that those graduates in nonagricultural occupations considered vocational agriculture of "little importance" in their occupations.

Business and bookkeeping was rated third, second, and fourth by farm operators, by those in farm-related occupations, and by those in

Table 6. Mean value ratings of high school course areas by occupation of graduate

Course area	Occupation											
	Farm operators			Farm related			Nonagricultural			Total		
	Rank[a]	N[b]	Mean value[c]	Rank	N	Mean value	Rank	N	Mean value	Rank	N	Mean value
Mathematics	1	240	3.73	1	133	3.66	1	473	3.57	1	846	3.63
Vocational agriculture	2	240	3.63	4	133	3.31	9	473	2.32	5	846	2.84
Business and bookkeeping	3	145	3.52	2	82	3.34	4	296	3.20	3	523	3.31
Industrial arts	4	153	3.34	8	82	2.61	8	305	2.47	7	540	2.74
English	5	240	3.05	2	133	3.34	2	473	3.48	2	846	3.34
Science	6	212	3.00	6	122	3.00	6	445	2.65	6	779	2.80
Speech	7	148	2.91	5	91	3.19	3	334	3.35	4	573	3.21
Foreign language	8	77	2.77	10	36	2.33	10	146	2.24	10	259	2.41
Social studies	9	240	2.72	9	133	2.51	7	473	2.64	9	846	2.64
Typing	10	205	2.44	7	105	2.82	5	403	2.84	8	713	2.72

[a]Placed in rank order according to mean values. [b]Number of farm operators who rated the course.
[c]Determined by coding "very important" with a value of 4, "important", 3; "little importance", 2; and "no value", 1.

nonagricultural occupations, respectively. However, the mean value ranged only from 3.20 to 3.52.

The farm operators rated industrial arts fourth in importance to them in their present occupations, those in farm-related occupations rated it seventh, and those in nonagricultural occupations rated it eighth.

A mean value of 3.05 for English was indicated by the farm operators, who rated it fifth in importance to them. Those in farm-related and nonagricultural occupations rated it second with mean values of 3.34 and 3.48 respectively.

Those individuals in nonagricultural occupations rated science sixth, with a mean value of 2.65, farm operators rated it sixth, with a mean value of 3, and those in farm-related occupations rated it sixth, also with a mean value of 3.

Speech was rated seventh in importance by farm operators, but fifth by those in farm-related occupations, and third by those in nonagricultural occupations. The mean values were 2.91, 3.19, and 3.35, respectively.

The farm operators rated foreign language eighth; those in farm-related and nonagricultural occupations rated it tenth. The mean values were 2.77, 2.33, and 2.24, respectively.

Social studies was rated ninth in importance by the farm operators, ninth by those in farm-related occupations, and seventh by those in nonagricultural occupations.

Those individuals in farm-related and nonagricultural occupations rated typing seventh and fifth, respectively; the farm operators rated it tenth. The mean values were 2.82, 2.84, and 2.44, respectively.

Occasionally some high school personnel propose to substitute industrial arts for vocational agriculture in the high school curriculum. This substitution would not improve the curriculum when all occupational groups are considered. Those graduates in nonagricultural occupations rated industrial arts with a mean value of 2.47 compared to a value of 2.32 for vocational agriculture. However, the farm operators rated industrial arts with a mean value of 3.34, compared to 3.63 for vocational agriculture. Those individuals in farm-related occupations rated industrial arts with a low 2.61 mean value, whereas they rated vocational agriculture with a mean value of 3.31. The mean value ratings were 2.74 for industrial arts and 2.84 for vocational agriculture by all the graduates in this study. In this study, foreign language was possibly rated higher by the farm operators than by those graduates in farm-related or nonagricultural occupations, as the farm operators in Texas hire Latin Americans as farm laborers who may speak Spanish.

Evaluation of Vocational Agriculture

Figure 2 presents the mean value rating of vocational agriculture, eight subject matter units, and five vocational agriculture or FFA activities in which the students could have participated while in high school. The five activities include the supervised farming program, FFA training, FFA leadership teams, agricultural judging teams, and participation in the fat stock shows. The farm operators rated all phases of vocational agriculture higher than did those individuals in farm-related and nonagricultural occupations, except the FFA leadership activities. Those individuals in farm-related occupations rated the leadership activities the highest. The individuals in nonagricultural occupations rated all phases as of "little importance" to them except

Figure 2. Evaluation of vocational agriculture by occupation of graduate

the FFA leadership activities, to which they gave a rating that approached that given by those in the other two occupational groups.

The mean value ratings of the five vocational agriculture or FFA activities by the graduates in each occupational group is indicated in Table 7.

Subject matter units in vocational agriculture

The mean value ratings of subject matter units in vocational agriculture by graduates according to occupation are presented in Table 8. Farm operators and those in farm-related occupations rated crop production first, whereas those in nonagricultural occupations rated FFA leadership activities first. The mean values for crop production were as follows: farm operators, 3.51; those in farm-related occupations, 3.21; and those in nonagricultural occupations, 1.96.

The farm operators rated farm management second in importance, whereas those in farm-related and nonagricultural occupations rated it third.

The farm operators rated soils third, whereas those in farm-related occupations rated it second, and those in nonagricultural occupations rated it fifth. Farm mechanics was rated fourth by the farm operators, fifth by those in farm-related occupations, and second by those in nonagricultural occupations.

The farm operators rated livestock production fifth, whereas those in farm-related or nonagricultural occupations rated it seventh in importance to them in their occupations.

The subject matter unit on agricultural occupations was rated sixth by those, who stated that it was taught, in all three occupational groups.

Those individuals in nonagricultural occupations rated the unit on

Table 7. Mean value ratings of vocational agriculture activities by occupation of graduate[a]

	Occupation					
	Farm operator		Farm related		Nonagricultural	
	N	Mean value	N	Mean value	N	Mean value
Vocational agriculture	240	3.63	133	3.31	473	2.32

Agricultural occupations	6	190	2.86	6	112	2.76	6	439	1.91
FFA leadership activities	7	238	2.75	4	130	2.87	1	467	2.66
Horticulture	8	176	2.70	8	98	2.58	8	400	1.75
Total number possible in each category		240			133			473	

[a]Placed in rank order according to mean value ratings.

[b]Number of farm operators rating the subject matter unit.

FFA leadership activities first in importance to them in their occupation, whereas those in farm-related occupations rated it fourth, and the farm operators rated it seventh. This unit was the only one for which the mean value was higher for those in farm-related occupations than for those who were farm operators. The mean values were as follows: those in farm-related occupations, 2.87; farm operators, 2.75; and those in nonagricultural occupations, 2.66.

Horticulture was rated eighth in importance to individuals of all three occupational groups.

The vocational agriculture teachers in Area I should review their course of studies to determine if they are giving proper emphasis to crop production, farm management, soils, and farm mechanics, as these units were rated highest by the farm operators and by those in farm-related occupations.

Future Farmers of America Degrees

The FFA degrees earned by the graduates when in vocational agriculture are compared to their present occupations in Table 9. The Green Hand Degree is the first degree that an FFA member can earn, followed by the Chapter Farmer, the State Farmer, and the American Farmer Degree.

Table 9. FFA degree earned by graduates when in vocational agriculture by occupation[a]

FFA degree	Occupation					
	Farm operator		Farm related		Nonagricultural	
	N	%	N	%	N	%
Green Hand	30	12.5	25	18.8	125	26.4
Chapter Farmer	148	61.7	92	69.2	303	65.1
State Farmer[b]	53	22.1	16	12.0	43	8.1
American Farmer	9	3.7	-	-	2	0.4
Total	240	100.0	133	100.0	473	100.0

[a]Chi-square value - 45.573. Table value at one-percent level and four degrees of freedom is 13.277. Significant at one-percent level.

[b]State Farmers and American Farmers were combined to compute the chi-square value.

Twenty-two and one-tenth percent (53) of the 240 farm operators had received a State Farmer Degree and 3.7 percent (9) had received an American Farmer Degree, whereas only 12.0 percent (16) of the 133 individuals in farm-related occupations and 8.1 percent (43) of the 473 in nonagricultural occupations had received the State Farmer Degree. None of those individuals in farm-related occupations had received an American Farmer Degree, and only two of the individuals in nonagricultural occupations had received this degree.

The percentage of individuals who had received only the Green Hand Degree was highest among those individuals who were in nonagricultural occupations. The percentages of the graduates who held this degree were as follows: farm operators, 12.5 percent; those in farm-related occupations, 18.8 percent; and those in nonagricultural occupations, 26.4 percent.

Little difference existed among the three occupational groups as to the number who had earned the Chapter Farmer Degree. Sixty-one and seven-tenths percent (148) of the farm operators had received this degree, 69.2 percent (92) of those in farm-related occupations, and 65.1 percent (303) of those in nonagricultural occupations had received the Chapter Farmer Degree.

Supervised farming program

Those individuals who were in nonagricultural occupations rated the supervised farming program of "little importance" to them in their occupations. The mean value was 2.08, compared to 3.10 for those graduates in farm-related occupations and 3.38 for those who were farm operators.

Data in Table 10 indicate the mean value ratings of the supervised farming program by the years of vocational agriculture completed in high school and the graduates' present occupation. The mean value increased as the years of vocational agriculture increased from one to three years for the three occupational groups: farm operators, farm-related occupations, and nonagricultural occupations. Those graduates who had completed four years of vocational agriculture and who were in nonagricultural occupations, or who were farm operators, rated the supervised farming program slightly lower than did those who had completed three years. Those in nonagricultural occupations who completed four years of vocational agriculture rated it with a mean value of 2.12, compared to 2.16 for those with three years. The farm operators who had completed four years of vocational agriculture rated the supervised farming program with a mean value of 3.37, compared to 3.49 for those with three years.

Those graduates who were in farm-related occupations and classified

by the number of years of vocational agriculture completed rated the supervised farming program with the following mean values: one year, 2.33; two years, 2.82; three years, 3.21; and four years, 3.44.

Forty percent (96) of the farm operators wished that they had been able to substitute management experience on the farm or in an agricultural business for the supervised farming program, whereas 44.4 percent (59) of those in farm-related occupations and 24.1 percent (114) of those in nonagricultural occupations desired to make this substitution.

Further research should be conducted concerning the desire of some graduates to substitute management and work experience on farms or in agricultural businesses for the vocational agriculture supervised farming program.

Table 10. Mean value ratings of supervised farming program by years of vocational agriculture and occupation

Years of vocational agriculture	Occupation					
	Farm operators		Farm related		Nonagricultural	
	N	Mean value	N	Mean value	N	Mean value
One	16	3.06	9	2.33	61	1.82
Two	44	3.23	38	2.82	138	2.06
Three	105	3.49	52	3.21	183	2.16
Four	75	3.37	34	3.44	91	2.12
Total	240		133		473	

FFA leadership training

Those graduates who were in farm-related occupations had received the most value from their FFA training. However, the farm operators had received nearly the same value, as the mean value computed was 3.17 compared to 3.24 for those in farm-related occupations. The graduates in nonagricultural occupations rated their FFA training considerably lower than did the other two occupational groups. The mean value computed for the nonagricultural group was 2.46.

The number of local, district, area or state FFA offices held is compared to the graduates' present occupation in Table 11. A larger percentage of those graduates who were farm operators had held an FFA office than had those who were in farm-related or nonagricultural occupations. Sixty-six and seven-tenths percent (160) of the 240 farm operators had held an FFA office, whereas only 58.6 percent (78) of those in farm related occupations and 51.6 percent (244) of those in

Table 11. FFA offices held by graduates while in vocational agriculture by occupations[a]

FFA offices held	Occupation					
	Farm operators		Farm related		Nonagricultural	
	N	%	N	%	N	%
None	80	33.3	55	41.4	229	48.4
One local office	89	37.1	45	33.8	156	33.0
More than one local office	52	21.7	25	18.8	74	15.6
District, area or state	19	7.9	8	6.0	14	3.0
Total	240	100.0	133	100.0	473	100.0

[a]Chi-square value - 21.378. Table value at one-percent level and six degrees of freedom is 16.812. Significant at one-percent level

nonagricultural occupations had held an FFA office. The farm operators and those in farm-related occupations had held more district, area or state FFA offices than had those graduates in nonagricultural occupations. The percentages of graduates who had held a district, area, or state office classified by occupation were as follows: farm operator, 7.9 percent; farm-related occupations, 6 percent; and nonagricultural occupations, 3 percent.

Little differences existed among the three occupational groups in the percentages of graduates who had held only one office. The percentage of those who had held more than one local office was highest among those who were farm operators. Twenty-one and seven-tenths percent of the farm operators, 18.8 percent of those in farm-related occupations, and 15.6 percent of those in nonagricultural occupations had held more than one local FFA office.

The mean value rating of FFA training was considerably higher for those graduates who had held one local office than for those who had not held an FFA office. As an example, the farm operators who had not held an FFA office gave their FFA training a mean value rating of 2.85, compared to a mean value of 3.24 given by those who had held a local office. These data indicate that a vocational agriculture teacher should encourage the FFA members to elect as many members as possible to local offices by selecting the officers from the vocational agriculture three and four classes to prevent a member from holding three local offices. Also junior officers, in addition to the regular chapter officers, could be elected. One hundred and fifty-one of the 846 graduates in this study held more than one local office.

The vocational agriculture teacher should also encourage his students

to work for advanced FFA degrees, as the value of FFA training increases as the degrees earned by the student advance from Green Hand to the American Farmer Degree. Those graduates who were farm operators and who had earned the Green Hand Degree while in FFA rated the FFA leadership training with a mean value of 2.87, those who had earned the Chapter Farmer Degree rated it with a mean value of 3.15, and those who had earned the State and American Farmer Degrees rated it with a mean value of 3.37.

FFA leadership contests

In Table 12 is recorded data of the participation of graduates in FFA leadership contests while the graduates were in high school as related to present occupations. Those individuals who were farm operators participated in all the contests more than did those in farm-related or nonagricultural occupations. Likewise, those in farm-related occupations participated slightly more than did those in nonagricultural occupations, except on the Chapter Farmer Farm Skill team. Six and eight-tenths percent of those in farm-related occupations participated on Chapter Farmer Farm Skills teams, compared to 8.2 percent of those in nonagricultural occupations.

The following percentages indicate the participation of the 846 graduates in the leadership contests regardless of occupation; Chapter Farmer Chapter Conducting, 29.7 percent (251); Green Hand Chapter Conducting, 29.6 percent (250); Chapter Farmer Farm Skills, 11.1 percent (94); Green Hand Farm Skills, 7.8 percent (66); Farm Radio, 7.6 percent (64); and FFA Quiz, 6.9 percent (58).

Table 12. Participation of graduates in FFA leadership contests by occupation

Leadership team	Occupation							
	Farm operator		Farm related		Nonagricultural		Total	
	N	%[a]	N	%	N	%	N	%
Chapter Farmer Chapter Conducting	84	35.0	39	29.3	128	27.1	251	29.7
Green Hand Chapter Conducting	82	34.2	41	30.8	127	26.8	250	29.6
Chapter Farmer Farm Skills	46	19.2	9	6.8	39	8.2	94	11.1
Green Hand Farm Skills	24	10.0	12	9.0	30	6.3	66	7.8
Farm Radio	22	9.2	10	7.5	32	6.8	64	7.6
FFA Quiz	18	7.5	9	6.8	31	6.6	58	6.9
Total of those who could have participated	240		133		473		846	

[a]The percentages were computed on the basis of the total number who could have participated in each occupational group.

Less than 12 percent of the graduates had participated in four of the six FFA leadership contests. Also only 65.4 percent of the graduates who were farm operators had participated in any FFA leadership contests, and only approximately one half of those in farm-related and nonagricultural occupations had participated in any FFA leadership contests. FFA leadership contests were rated higher than any other FFA or vocational agriculture activity by those who had participated in them and who were employed in nonagricultural occupations. The mean value rating given these contests by this occupational group was 2.95, compared to 2.99 for farm operators and 3.24 for those graduates in farm-related occupations. The value of

leadership contests to the graduates in each occupational group increased as the number of contests that they participated in increased and as the level of participation increased, with one exception. Those graduates who were in farm-related occupations and who had participated at the area or state level rated the value of leadership contests slightly lower than did those who had participated at only the district level.

It should be emphasized that graduates in farm-related occupations rated FFA training and training received from participating in FFA leadership contests higher than did the individuals in the other two occupational groups. Consequently, agricultural education personnel who are planning new programs for high school graduates in farm-related occupations should continue some type of leadership training for this group.

Agricultural judging contests

The participation of graduates in agricultural judging contests is presented in Table 13. Since numerous graduates participated in more than one contest while they were enrolled in vocational agricusture, the percentage of participation was computed by dividing the total number who could have participated in each occupational group into the number who did participate in each contest. Also, no distinction was made as to whether the participation was on a local, a district, an area, or a state basis.

The farm operators had participated in the various agricultural contests more than those who were in farm-related occupations or those in nonagricultural occupations, with the exception of the participation in the poultry and meats contest. Eight and three-tenths percent of the farm operators had participated in the poultry contest, 12.8 percent of those in farm-related occupations, and 12.3 percent of those in nonagri-

Table 13. Participation of graduates in agricultural judging contests

Contest	Occupation							
	Farm operators		Farm related		Nonagricultural		Total	
	N	%[a]	N	%	N	%	N	%
Livestock	116	48.3	51	38.3	154	32.6	321	37.9
Dairy Cattle	68	28.3	33	24.8	106	22.4	207	24.5
Dairy products	15	6.3	2	1.5	24	5.1	41	4.9
Cotton classing	26	10.8	14	10.5	41	8.7	81	9.6
Crops	46	19.2	24	18.0	66	13.9	136	16.1
Poultry	20	8.3	17	12.8	58	12.3	95	11.2
Meats	12	5.0	13	9.8	38	8.0	63	7.4
Land	19	7.9	7	5.3	31	6.6	57	6.7
Total of those who could have participated	240		133		473		846	

a The percentages were computed on the basis of the total number of each occupational group who could have participated.

cultural occupations had participated. Only 5 percent of the farm operators had participated in the meats contest when they were taking vocational agriculture, whereas 9.8 percent of those in farm-related occupations and 8 percent of those in nonagricultural occupations had participated. Only 1.5 percent (2) of the 133 graduates who entered farm-related occupations had participated in the dairy products contest. Six and three-tenths percent of the farm operators and 5.1 percent of those in nonagricultural occupations had participated in this contest.

The participation of the graduates in agricultural judging contests was low, as less than one fifth of the graduates had participated in six

of the eight contests. Also, 37 percent of the graduates had not participated in any of the eight contests. The eight contests rated according to participation by all graduates in descending order were: livestock, 37.9 percent; dairy cattle, 24.5 percent; crops, 16.1 percent; poultry, 11.2 percent; cotton classing, 9.6 percent; meats, 7.4 percent; land, 6.7 percent; and dairy products, 4.9 percent. The graduates who were farm operators and who were in farm-related occupations rated the value of agricultural judging contests considerably higher than did those graduates in nonagricultural occupations. The mean values by occupation were as follows: farm operators, 3.30; those in farm-related occupations, 3.02; and those in nonagricultural occupations, 2.40. With only one exception, the value of agricultural judging contests to the graduates in each occupational group increased as the number of contests that they had participated in increased and as the level of participation increased from local to state. The graduates in a nonagricultural occupation who participated in three or more agricultural contests rated the value of these contests slightly lower than did those who had participated in two contests.

Fat stock shows

The participation of graduates in fat stock shows classified by their present occupation is indicated in Table 14. Seventy-one and two-tenths percent of the farm operators had participated in fat stock shows, whereas only 58.7 percent of those graduates in farm-related occupations and 55.8 percent of those in nonagricultural occupations had participated. Very little difference existed between the three occupational groups in the number who had participated in one or two and three or four fat stock shows. Thirty-three and eight-tenths percent of the farm operators had participated in five or more fat stock shows, compared

Table 14. Participation of graduates in fat stock shows by occupation

Times showed livestock	Occupation							
	Farm operator		Farm related		Nonagricultural		Total	
	N	%	N	%	N	%	N	%
None	69	28.8	55	41.3	209	44.2	333	39.4
One or two	51	21.2	25	18.8	104	22.0	180	21.3
Three or four	39	16.2	28	21.1	77	16.3	144	17.0
Five or more	81	33.8	25	18.8	83	17.5	189	22.4
Total	240	100.0	133	100.0	473	100.0	846	100.0

to only 18.8 percent of those in farm-related occupations and 17.5 percent of those in nonagricultural occupations who had participated in five or more stock shows.

The 846 graduates had participated in fat stock shows as follows: no participation, 39.4 percent (333); one or two times, 21.3 percent (180); three or four times, 17.0 percent (144); and five or more times, 22.4 percent (189).

Graduates in nonagricultural occupations rated the training that they had received in fitting and showing livestock considerably lower than did the farm operators and those in farm-related occupations. The mean value ratings of fat stock shows for the three occupational groups were as follows: farm operators, 2.86; those in farm-related occupations, 2.56; and those in nonagricultural occupations, 2.03.

The number of times a farmer had fitted and shown livestock had a direct relation to the increased value rating of fat stock shows.

The mean values of fitting and showing livestock to farm operators by extent of participation were as follows: one or two times, 2.51;

three or four times, 2.72; five or six times, 2.90; and seven or more times, 3.30.

However, the relationship of the number of times a graduate who was in a farm-related occupation fitted and showed livestock to the value of participating in fat stock shows was not significant. The mean values by the number of times those individuals in farm-related occupations showed livestock were as follows: one or two times, 2.60; three or four times, 2.32; and five or more times, 2.80.

The number of times that a graduate who was a farm operator or who was in farm-related occupations fitted and showed livestock did not significantly affect his opinion concerning the value of the supervised farming program and had little effect on the value of the livestock production unit.

SUMMARY

The objectives of this study were to determine the present occupational status of West Texas high school graduates of 1953, 1954 and 1955 who had completed one or more years of vocational agriculture. Other objectives were to determine factors related to occupational choices of graduates; to evaluate the high school course areas and the vocational agriculture programs as related to the occupations of the graduates; and to determine possible changes that could be made in vocational agriculture in order to meet the needs of male high school graduates.

The data used in this study were secured from the permanent records of 45 high schools and from completed questionnaires obtained from 846 graduates. The number of students represented 70.4 percent of the graduates whose addresses were available.

Twenty-eight and four-tenths percent (240) of the graduates were farm operators, 15.7 percent (133) were employed in farm-related occupations, 59.5 percent (419) had entered nonagricultural occupations, and 6.4 percent (54) were in the military services.

The following factors were related to the occupational choices of the graduates at the one-percent level of significance when tested by use of the chi-square statistical method: occupation of the father, acres of land operated by the father while the son was in high school, years of vocational agriculture completed by the high school graduate, and the graduate's subsequent attendance at college. In other words, if the father was in an agricultural occupation, and as the size of the farm operated by the father increased and as the number of years of vocational agriculture completed by the graduate increased, the more likely

a graduate would enter an agricultural occupation. However, only 17.1 percent of the respondents who became farm operators graduated from college compared to one-third of those respondents who were employed in farm-related and nonagricultural occupations. The scholastic rank of the high school graduate was significant at the five-percent level. A slightly lower percentage of those individuals graduating in the upper half of their graduating class became farm operators than those graduating in the lower half. The relation of the size of high school attended and the occupational choice of the graduate was not significant.

Approximately three fifths of the 846 graduates had attended college. One half of those who had attended college had received a degree.

The graduates, not classified by occupation, rated the high school course areas in the following descending order: mathematics, English, business and bookkeeping, speech, vocational agriculture, science, industrial arts, typing, and foreign language. The farm operators rated vocational agriculture second and those graduates in farm-related occupations rated it fourth.

The farm operators rated the eight subject-matter units in vocational agriculture in the following descending order: crop production, farm management, farm mechanics, livestock production, soils, agricultural occupations, FFA leadership activities, and horticulture. The graduates in farm-related occupations rated soils and FFA leadership activities higher than did the farm operators.

The supervised farming program was rated "important" to the farm operators and those in farm-related occupations but of "little importance" to those in nonagricultural occupations.

Graduates who were in farm-related occupations or were farm opera-

tors received the most value from their FFA training indicating its value as "important". The graduates in the three occupational groups who participated in FFA leadership contests rated the training as "important" in their present occupations.

The graduates who were farm operators and who were in farm-related occupations rated the value of agricultural judging contests considerably higher than did those graduates in nonagricultural occupations. Graduates who were farm operators had greater participation and received more value from training received in fitting and showing livestock than did the other groups.

The implications of the findings of this study for vocational agriculture in the Panhandle-Plains area of Texas are as follows:

Pilot studies for senior students who plan to enter farm-related occupations are necessary to determine if management experience on a farm or in an agricultural business would be beneficial to students entering these occupations.

Teachers may need to be more selective in the students who enroll in vocational agriculture as those students who entered nonagricultural occupations rated most phases of their vocational agriculture training as of "little importance" in their occupations.

The vocational agriculture teacher and the guidance director should share in providing occupational guidance since nearly one-third of the students in this study who had entered agricultural occupations had completed only one or two years of vocational agriculture, and since approximately three-fifths of the individuals who were in agricultural occupations and who had had some college training had selected nonagricultural majors in college.

The vocational agriculture teachers in Area I may need to review their courses of studies to determine if they are giving proper emphasis to crop production, farm management, soils, and farm mechanics, as these units were rated most important by those in agricultural occupations. The usefulness of content and effectiveness of instruction of the other units in the courses of studies should be evaluated and improved.

Supervised farming programs that are of large enough scope to challenge all students are needed as the farm operators and those in farm-related occupations rated the farming program as "important" in their present occupations.

Vocational agriculture teachers should make maximum use of the FFA and continue to encourage students to obtain advanced degrees and to participate in FFA activities as leadership training was rated as "important" to all graduates.

The vocational agriculture teachers may need to evaluate carefully each FFA and agricultural judging contest as the participation in some contests was extremely low.

Young farmer programs appear to be needed in most schools, as the farm operators in this study, whose average age was 27, farmed a median of 536.5 acres. It is the vocational agriculture teacher's responsibility to help young farmers obtain information to make their farms efficient units.

APPENDIX A: FACTORS RELATED TO THE OCCUPATIONAL CHOICES OF GRADUATES

(See pages 12-17 for discussion of results)

Null hypothesis	Degrees of freedom[a]	Chi-square value	Level of significance in percent
No relationship exists between the occupation of the father and the occupation of the son that could not be attributed to random sampling differences	6	121.853	1
No relationship exists between the number of acres of land operated by the father while the son was in high school and the son's present occupation	12	130.647	1
No relationship exists between the years of vocational agriculture completed by the graduate while in high school and his present occupation	9	29.744	1
No relationship exists between the size of high school attended by the graduate and his present occupation	6	11.395	Not significant
No relationship exists between the grade quartile obtained by the student while in high school and his present occupation	9	17.878	5
No relationship exists between college attendance of graduate and his present occupation	6	46.005	1

[a]Degrees of freedom	Table value at five-percent level	Table value at one-percent level
6	12.592	16.812
9	16.919	21.666
12	21.026	26.217

APPENDIX B: EVALUATION OF VOCATIONAL AGRICULTURAL ACTIVITIES

(See Table 7, Page 27, for mean values)

Null hypothesis	Degrees of freedom	Chi-square value	Level of significance in percent
No difference existed between those graduates who were farm operators and those who were in farm-related occupations and the value they placed on the supervised farming program in their present occupation	2	10.283	1
No difference in the value of FFA training existed between those who were farm operators and those who were in farm related occupations	2	1.017	Not significant
No difference in the value of leadership contests to participants existed between those who were farm operators, those who were in farm-related occupations and those in nonagricultural occupations	4	10.630	5
No difference existed between those graduates who were farm operators and those who were in farm-related occupations and the value of agricultural judging contests in their present occupations	2	8.275	5
No difference existed between the farm operators and those in farm-related occupations in the value of fitting and showing livestock in their present occupations	3	8.04	5

[a] Degrees of freedom	Table value at five-percent level	Table value at one-percent level
2	5.991	9.210
3	7.815	11.341
4	9.488	13.277

APPENDIX C: ANALYSIS OF VARIANCE IN VALUES OF VOCATIONAL AGRICULTURE SUBJECT MATTER UNITS EXPRESSED BY GRADUATES WHO WERE FARM OPERATORS OR EMPLOYED IN FARM-RELATED OCCUPATIONS

(See pages 24-29 for discussion of results)

Source of variation	d.f.	s.s.	m.s.	F
Occupation[a]	1	45.75	45.75	10.40
Error (a)	264	1,162.23	4.40	
Subject matter units[b]	7	334.75	47.82	53.97
Occupation X subject matter units[c]	7	38.61	5.52	6.23
Within	1848	1,637.39	0.886	
Total	2127	3,218.73		

[a]For occupation F1, 264 = $\frac{45.75}{4.40}$ = 10.40**. Table value at one-percent level is 6.74.

[b]For subject matter units F7, 1848 = $\frac{47.82}{0.886}$ = 53.97**. Table value at one-percent level is 2.64.

[c]For occupation X subject matter units F7, 1848 = 5.52 = 6.23**. Table value at one-percent level is 2.64.

**Significant at one-percent level.

The data was treated with a factoral analysis of variance design to determine if any differences existed between the way farm operators and those in farm-related occupations rated the vocational agriculture subject matter units that they took while in high school. The graduates in nonagricultural occupations were not included in this analysis, as their ratings of the various units were obviously lower than those of graduates who were farm operators or who were in farm-related occupations, and this difference was not of interest to the author.

To compute the analysis of variance, the ratings of the graduates were coded as follows: "very important", 5; "important", 4; "little importance", 3; "no value", 2; and "was not taught", 1. In reviewing the results of this analysis, one should remember that all graduates in farm-related occupations and the random sample of 133 farm operators were included in the analysis, including those who said that a unit "was not taught". The numbers of the 846 graduates who stated that subject matter units were not taught were as follows: soils, 74; crops, 18; horticulture, 172; farm management, 59; farm mechanics, 55; livestock production, 4; agricultural occupations, 105; and leadership activities, 11.

The analysis of variance program available for the computer was developed for a balanced design. Consequently, a sample of 133 farm operators was randomly selected from the total of 240 farm operators in order that the number of farm operators would be the same as that of graduates who were in farm-related occupations, 133. The factors considered in this analysis were the two occupations and the eight subject matter units. The coded rating by a graduate for each subject matter unit was punched on I.B.M. cards. The total number of cards punched was 2128, as there were two occupations, eight subject matter units, and 133 replications (occupation x unit x replication; 2 x 8 x 133).

The null hypothesis that no difference existed between the way farm operators and those in farm-related occupations rated vocational agriculture courses that could not be attributed to random sampling differences was tested. The F value of 10.40 with one and 264 degrees of freedom for occupations was significant at the one-percent level. Therefore, evidence existed that a significant difference existed between the way farm operators and those in farm-related occupations rated vocational agriculture. The mean values of vocational agriculture rated by the farm operators was 3.91 and 3.61 by those in farm-related occupations.

The null hypothesis that no difference existed between the way the eight subject matter units were rated by those graduates who were in agricultural

occupations that could not be attributed to random sampling differences was tested. The F value of 53.97 with seven and 1848 degrees of freedom was significant at the one-percent level, and thus the null hypothesis was rejected. The mean value for each subject matter unit was as follows: soils, 3.91; crops, 4.30; horticulture, 2.95; farm management, 3.97; farm mechanics, 3.94; livestock production, 3.96; agricultural occupations, 3.33; and FFA leadership activities, 3.66.

The occupation and subject matter interaction was tested. The null hypothesis that no difference existed between the way farm operators and those in farm-related occupations rated the eight subject matter units taught in vocational agriculture that could not be attributed to random sampling differences was tested. The F value of 6.23 with seven and 1848 degrees of freedom was significant at the one-percent level, and thus the null hypothesis was rejected. Therefore, evidence showed that a difference did exist between the way farm operators and those in farm-related occupations rated the eight subject matter units taught in vocational agriculture. The differences in mean values between the way that the farm operators and those in farm-related occupations rated the subject matter units were as follows: soils, 0.40; crops, 0.37; horticulture, 0.11; farm management, 0.76; farm mechanics, 0.37; livestock production, 0.48; agricultural occupations, 0.02; and FFA leadership activities, 0.14. The farm operators rated all the subject matter units higher than did those in farm-related occupations, except the unit of FFA leadership activities.

*FEMALES, *EMPLOYMENT OPPORTUNITIES, GEOGRAPHY, POPULATION DISTRIBUTION, ECONOMIC FACTORS, *EDUCATIONAL BACKGROUND, HEALTH SERVICES, EMPLOYMENT STATISTICS, FAMILY INCOME, OCCUPATIONS, RURAL AREAS, JOB TRAINING, *ESKIMOS, *OCCUPATIONAL HOME ECONOMICS,

Alaska,

Individuals and employers were interviewed in 25 towns and villages, during 1964-65 to determine -- (1) employment opportunities for women in Alaska, (2) previous job training for women, (3) the best methods of training women for available employment, (4) the need for new employment opportunities, and (5) possible new training programs. Information on the economy, geography, educational facilities, health services, and women's employment is organized by geographic regions. Background information is given on the education and working conditions of women, and the health problems of the region. Many women seeking work in Alaska were unskilled. Many Alaskan families lived in substandard housing because of low income. Job opportunities in the larger towns were more plentiful for the trained women but were scarce for the untrained. Eight recommendations included -- (1) The effort to prevent high school dropouts should be increased, (2) High schools should offer intensive courses in home economics for employment preparation in schools where the dropout rate is high, and (3) Vocational education for women should include course in money management. Separate recommendations were made for Eskimo villages. (MS)

A	Guide for Interviewing Employers
B	Community Survey Form
C	Guide for Interviewing Individuals
D	Communities Visited

INTRODUCTION

The economy, climate, and population characteristics of Alaska are so varied regionally that it would have been impractical to try to reach conclusions pertaining to employment that could apply to the whole State, so this report is divided into sections that are related by geography, economy, and ethnic origins.

There was poverty in some of the villages as serious as that found anywhere in the United States. At the same time, many of the towns were enjoying an unprecedented prosperity; and, in some, the rate of increase in individual income was among the highest in the United States during 1964.

Anti-poverty programs and other government projects that were being introduced to Alaskan communities changed some conditions during the year and could be expected to have an effect on women's work, as well as to reduce the number of people on welfare and the number of high school drop-outs.

Individuals and employers were interviewed in the twenty-five towns and villages visited. A list of these places and forms used as guides for the interviews and community surveys are shown in the appendix. Population information in the text, unless otherwise noted, is based upon United States census figures for 1960.

The term native is used for persons one-fourth or more Eskimo, Indian, or Aleut. The main body of the United States is referred to as Outside, in keeping with common Alaskan usage. Physically handicapped describes a person who has a physical or mental impairment which can be expected to be of a long-continued or indefinite duration and which substantially im-

pedes his ability to live independently. A dropout is a student who leaves school for any reason before completing requirements for graduation from high school. Vocational education is a form of training, the purpose of which is to fit persons for useful employment.

For a better understanding of the problems related to the employment of native women, the following reports should be read: Alaska Native Arts and Crafts, Potential for Expansion, Final Report to Bureau of Indian Affairs, University of Alaska, 1964; and Alaskan Native Secondary School Dropouts, University of Alaska, 1962.

The author is indebted to Mrs. Pat Leonard for her assistance; to Mrs. Mildred Foster and Dr. Earl Hepler for their advice and encouragement; and to Mr. Eugene Short, Director of the Anchorage Community College, for making space and facilities available.

CHAPTER I

THE PROBLEM

Purpose of the study. On August third, 1964, a research project was started to collect data pertaining to gainful and useful occupational skills of women in Alaska in order to carry out the directive as stated in the Vocational Education Act of 1963:

> "Ten per centum of the sums appropriated pursuant to Section 2 (authorization of appropriations section) for each fiscal year shall be used by the Commissioner to make grants to colleges and universities, and other public or non-profit private agencies and institutions, to State boards, and with approval of the appropriate State board to local educational agencies, to pay part of the cost of research and training programs and of experimental, developmental, or pilot programs developed by such institutions, boards, or agencies, and designed to meet the special vocational education needs of youths, particularly youths in economically depressed communities who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education programs."

Besides pointing out the need for research, the vocational law stated than ten per cent of the home economics funds in each state MUST be used in developing "gainful occupations for women and girls through development of the knowledge and skills of home economics".

The objectives of the survey were:

1. To become familiar with employment opportunities for women in Alaska.
2. To find out what training Alaskan women have already had for these jobs.
3. To determine ways that they can best be trained for available employment.
4. To investigate the need for new employment opportunities.
5. To suggest program development.

Importance of the study. The increase in the number of women combining the roles of homemaker and wage earner makes it necessary for them to be trained for proficiency in a job as well as in management and skills related to family life.

In order to know what programs should be provided to train women for employment utilizing home economics knowledge and skills, a study was made based upon the following assumptions:

1. The percentage of working women will continue to increase for several years.
2. Job opportunities for women are increasing and will continue to do so.
3. The opportunities in available jobs and the incidence of success will be greater for trained than for untrained women.
4. Training programs should be geared to present and projected employment opportunities.
5. Many families depend upon the wife's income to provide an acceptable standard of living.
6. Many women have not completed high school.
7. A significant number of women have not completed the eighth grade.
8. It is important to train some women for trades using homemaking skills so that they may realize income based upon these abilities.
9. Physically handicapped women can be given opportunities for employment.

10. Vocational education for women can fill a need not covered by other agencies.

11. Employers of women will benefit from hiring trained personnel.

12. There is a need for more day care centers for children of working mothers.

13. Legislation can improve work opportunities and working conditions for women.

Limitations of the study. Six months in appropriate periods throughout the fiscal year 1964-1965 were allotted for the study. The writer was designated to visit twenty-five cities and villages in Alaska to interview, survey, analyze data, report findings, and to suggest programs.

CHAPTER II

REVIEW OF THE LITERATURE

Alaska's womanpower. The Research and Analysis Section of the Alaska State Employment Service published a bulletin in 1963 which showed that 19 per cent of persons earning some income in Alaska during 1959 were wives of household heads and that 52 per cent of the married women in Alaska had earned some income that year. There were 23,600 women workers in Alaska in 1960, with the greatest number of these twenty-five to forty-four years of age. The bulletin showed that because of earlier marriages, mothers will be younger when their children reach school age and that more women between the ages of thirty-five and forty-four will be free to take jobs.[1]

The distribution of women seeking jobs through local offices of the Alaska State Employment Service by occupational classification in April, 1960, were as follows:[2]

Professional and Managerial	49
Clerical and Sales	462
Service	222
Skilled	7
Unskilled	81
Semi-skilled	33
Total Number	854

---

[1] Alaska's Manpower; A Look at the 1960's. Prepared by Research and Analysis Section, Alaska Department of Labor, Employment Security Division, 1963. p. 9.

[2] Ibid., p. 25.

In connection with the above figures, taken from a table that included male workers as well as female, the report stated:

> The fact that many of the people looking for work are among segments of the workforce generally recognized as the most employable is an indication that more job development work needs to be done. Among the positive alternatives available are: fuller utilization by the community of the services available for bringing jobs and workers together; development of an adequate and work-oriented vocational education system, full participation in Federal programs designed to provide short intensive training for the unemployed; and continuation of vigorous efforts to promote increased utilization of Alaska's natural resources.[3]

This reflected a national trend. A United States Department of Health, Education, and Welfare publication of 1962 showed that the older her children, the more likely it was that a mother was employed and that of all children twelve to seventeen years of age living in husband-wife families, 33 per cent had an employed mother. The leaflet also pointed out that economic necessity probably was the major reason why mothers worked and that the lower the father's income, the larger the proportion of children whose mothers were employed. Forty-four per cent of children, living with their employed mother only, had mothers whose income was less than $2,000 a year. An additional 39 per cent of this group had mothers whose income was between $2,000 and $4,000 a year.[4]

Day care for children of working mothers was largely in the hands of fathers or other relatives who cared for six out of ten children whose mothers were employed full time. The others were cared for away from home by relatives, neighbors, or in group care, or under other arrangements.

---

[3] Ibid., p. 25.

[4] U. S. Department of Health, Education, and Welfare, Social Security Administration, Children's Bureau. Working Mothers and Day Care Services in the United States. 1962. p. 2.

A survey in 1958 showed that about 400,000 children under twelve were expected to take care of themselves while their mothers worked full time.[5] Of the 22,219 women who were working in Alaska in 1960, 5,439 had children under six years of age.[6]

Native employment. Social and economic problems associated with acculturation of Alaskan natives were mentioned by several authors. The native populations, largest in the southwest and northwest regions, have the lowest employment growth potential, according to Rogers.[7]

The 1960 census showed that the income in the native villages was noticeably lower than in the towns with predominantly white populations. There had been little vocational training to prepare these people for jobs in the villages, or in the towns where many had moved since World War II.

Employment of village women. A report made by the Employment Security Division in 1964 showed that a census of ninety-one Eskimo communities taken in 1962 indicated that there were 1,244 women living in the area and that of this number thirty-five women, or 2.8 per cent had permanent employment and that forty-one had temporary employment. Permanently unemployed women numbered 513 and there were forty-six temporarily unemployed.[8]

Women's employment in the villages differed from the accustomed work in urban areas. VanStone pointed out that women contributed to the real income of the family in the villages in many ways. This was shown by a description of subsistence activities in Point Hope:

> Although men dominate the cycle of subsistence activities, women have a definite part to play. Men do all the hunting but women take an active part in hunting activities at all times of the year, and do most of the fishing. During whaling, women not only participate in the preparations when they sew new covers for the skin boats but they are an integral part of activities on the ice. A whaling camp that has no woman to take charge of the preparation and serving of meals is under a considerable hardship from the standpoint of both efficiency and comfort. In summer when boats leave for Cape Lisburne to hunt caribou and gather murre eggs, one or two women are usually in the crew and take an active part in every aspect of the trip, even to the extent of doing some hunting themselves. A man and his wife frequently hunt caribou together during the summer months. Women do all the preparation of meat and skins and thus have a keen interest in winter and spring hunting. A man and his wife thus form an active partnership for carrying out the subsistence activities. A woman helps her husband in innumerable ways each day; e.g., she may help him harness his dogs before he sets out to hunt in the early morning and be ready to aid him in unloading his catch in the evening.[9]

Hughes, in his study of an Eskimo village, found that the most important form of "unearned" income for the village as a whole was provided by the Department of Public Welfare of Alaska, which gave monthly financial aid such as general relief, old-age assistance, and aid to dependent children. He remarked that it had increased markedly through the years since 1940 and that the widow's allowance and the temporary assistance given to a family when the husband was sick or disabled had begun to be considered perhaps more as a "way to make money" than as temporary financial assistance. For people with little income or no income, the welfare checks were

---

[9]James W. VanStone, Point Hope. Seattle: University of Washington Press, 1962. p. 76.

greatly prized.[10]

Family income in the villages. ". . . in 1955, the distribution of estimated income by families was recorded as follows:

Under $100	$100-$199	$200-$299	$300-$399	$400-$499
2	1	2	1	1

$500-$749	$750-$999	$1,000-$1,499	$1,500-$1,999
9	7	15	10

These figures were obtained from records compiled by the Bureau of Indian Affairs and are supposed to include both earned income and an estimated cash value for native products. Since it is practically impossible to estimate the money value of things such as seals, tomcod, and whale meat, the foregoing figures should be considered as only approximate. It appears, though, that half the families in the village have an income of more than $1,000 a year, most of which doubtless comes from summer employment.[11]

Native education. Havighurst made the following statement about the cultural and individual aspects of Indian education, which may well apply to the Alaskan native:

> . . . American Indian groups have not taken part in American education at the secondary and higher levels as have European immigrant groups . . . [They] have clung to enough of their traditional cultures to prevent them from adopting fully the white American culture, including its attitudes toward education and its use of education as a means of social mobility and occupational achievement.
>
> . . . It seems that the Indian groups who do move into the American culture do so at the lower economic levels and require a generation or two to learn the ways of upward mobility, including the use of education for this purpose.
>
> Individual Indians have done very well in the American educational system by committing themselves to learning the dominant American culture and living in it. The number of such people is relatively small and gives evidence of the great holding power of many of the traditional Indian cul-

[11]VanStone, op. cit., p. 145.

tures upon their members.[12]

Adult education. A State Board of Vocational Education, the official governing body of vocational education, was responsible for the administration of Federal programs within the State: Smith Hughes Act, Public Law 347, George-Barden Act, National Defense Education Act, Manpower Development and Training Act, Area Redevelopment Act, and the Vocational Education Act of 1963. The Economic Opportunity Act of 1964, Public Law 88-452, provided education for employability, though not under the direct jurisdiction of vocational education.[13]

Nationally, the Manpower Development and Training Act was administered by the Secretary of Health, Education, and Welfare through the Office of Education. The Secretary of Labor directed surveys of employment opportunities in each state and was responsible for selection of trainees, payment of training allowances, and placement.

An expression of the need for a greatly expanded program of adult education in the villages was made by members of the Task Force on Alaska Native Affairs. They recommended that the program should be directed toward more than reducing the rate of illiteracy among the older natives. They suggested that it should include instruction in community organization, the preparation and preservation of foods, gardening, the development of small

[13]What is Vocational Education? Juneau, Alaska: Department of Education, Division of Vocational Education, [1965].

industries in the home and in the village, and the conservation of fish and game.[14]

The Division of Statewide Services, University of Alaska, included all general extension education, off-campus and public service activities typically provided at any of the land-grant universities. It made available to residents of the State not enrolled as regular students, educational programs of a non-credit as well as of a credit nature and other special services.

Many native young people were not eligible for admission to college because of the inadequacy of their earlier education. A study in 1960 showed that over one-fourth of the native children between fourteen and nineteen years of age were not in school and that almost one-third of the 5,365 children of that age group were still in elementary school.[15]

Professor Lee Salisbury of the University of Alaska said:

> Although the Alaskan native college entrant has already survived an attrition rate as high as 60 per cent in grade school and 28 per cent in high school and is assured of continuing BIA financial support, he has only one chance out of 24 of receiving a college degree---exactly half that of his non-native Alaskan counterpart.[16]

The Bureau of Indian Affairs' Branch of Employment Assistance administered two types of programs: employment assistance for those adults seeking job opportunities in the continental United States, and adult vocational training to help Indians and Eskimos obtain satisfactory employment

through vocational counseling, institutional training, apprenticeships, and on-the-job training. Indians and Eskimos qualifying for this assistance had to be between the ages of eighteen and thirty-five. Financial assistance in the form of grants was given during the training period.[17]

During the year that research was conducted for this report, Federal authorities had become interested in accelerating anti-poverty programs, and vocational education offerings in the State had been expanded, many of them to train women. Courses in practical nursing and office work had been particularly popular in the urban areas. Many hard-to-reach people in the lower income classifications and sparsely populated areas still had economic needs that weren't being met by current training programs, obvious to the most casual observer traveling in the remote areas. Administrators of many government agencies were aware of this situation.

CHAPTER III

ESKIMO VILLAGES

Geography. The Eskimo villages with which this study was concerned were located on the shore of the Chuckchi and Beaufort Seas north of 59°. The main populations were along, or near, the mouths of the Kobuk, Noatak, Ipewik, Avalik, Meade, and Ikpikpuk Rivers, all of which drain into the Arctic Ocean, and the Kuskokwim and Yukon Rivers draining into the Bering Sea. Dillingham was included, although it was further south, because the sociology and economy were so similar.

The climate of the Arctic was described by Spencer as follows:[1]

> In the truest sense, the Alaskan Arctic plain is a desert. Rain and snowfall are very slight, averaging not more than 5 to 7 inches per year . . . The principal basis for seasonal differentiation lies not in rainfall, but in the differing intensity of temperature and in the length of daylight. The brief summer season is marked by a thaw and, for a two-month period, by 24-hour sunshine. The transition from 24 hours of sunlight in late July to the fall equinox is most rapid, and, again, the shift from the equinox to the winter solstice involves the change in a short period from 12 hours of daylight to total darkness. At Point Barrow, for example, at 71° 23' N., 72 days of winter darkness, beginning November 15, are the rule. Temperature changes cannot be regarded as extreme. In summer, the averages hover somewhat above freezing, although highs of 60° or 65° F. may be reached for short periods. From this, there is a gradual shift to the winter temperatures. These are not so extreme as might be imagined, particularly along the coast where 30° F. below zero may be regarded as essentially average . . . The winter temperatures of the region, while by no means so cold in comparison with the 50° to 70° below zero readings of the deeper interior, as in the forested zones of continental type climate, are nonetheless infinitely more severe as a result of intensity of wind. In the Arctic plain and foothills, a somewhat more adequate adjustment on the part of humans in terms of clothing and housing is a necessity. The frigid winters are very long and the summer brief. Physiographic change is slow and little climatic variation has been noted since the 1880's when climatic

---

[1]Robert F. Spencer, The North Alaskan Eskimo. Smithsonian Institution, Bureau of American Ethnology, Bulletin 171. U. S. Government Printing Office, Washington, 1959, pp. 11-12.

data were compiled for the first time and the coastal temperatures at Point Barrow were found to average on a yearly basis 8° F. above zero (Murdoch, 1892, p. 30). Streams and lakes are blocked with ice for much of the year and usually by November the ice has begun to form on the ocean, creating a pack which may remain unbroken until the following summer, often as late as August or September, or later.

Development of these northern villages was limited by permafrost which made it difficult to secure a safe supply of water and a sanitary method of disposing of human waste.

Population. Barrow, with 2,133 and the Kobuk with 3,560 represented the most highly populated election districts in the Alaskan Arctic in 1960.[2]

Village populations at that time were as follows:

Barrow	1,314
Kivalina	142
Kotzebue	1,290
Noatak	275
Noorvik	384
Point Hope	324
Selawik	348
Shishmaref	217
Wainwright	253

The native population represented 84.9 per cent of the total number of inhabitants in these election districts.

There were 1,605 natives in Barrow, 1,599 of whom were born in Alaska and 3,232 in the Kobuk district, with 3,180 of that number having been born in the State.

---

[2]Bureau of Vital Statistics, Alaska Department of Health and Welfare. Population of Election Districts: 1960 and Population of All Incorporated Places and of Unincorporated Places of 25 or More: 1960 and 1950. Juneau: March 1, 1961. pp. 1-9.

Marital and family status were reported as follows:

Non-white Population	Barrow	Kobuk
Married couples	239	437
With own household	222	411
With own children under 6	192	274
With own children under 18	209	338
With husband under 45	146	254
Families	237	530
Husband-wife families	222	411
With own children under 6	175	286
With own children under 18	195	369
Unrelated individuals	90	132
Persons under 18 years old	905	1,728
Living with both parents	853	1,389

ADULT POPULATIONS BY SEX AND AGE OF FOUR ESKIMO VILLAGES

Age Group:	15 - 24		25 - 34		35 - 44		45 - 54		55 - 64	
Sex:	M	F	M	F	M	F	M	F	M	F
Kotzebue	133	83	117	71	77	50	58	41	34	19

Point Hope	33	23	23	16	11	10	13	13	5	5
Shishmaref	20	12	12	14	11	11	7	7	6	1

Exhibit A: A paper supplied by E. Arthur Patterson, Projects Development Officer, Bureau of Indian Affairs, Nome, Alaska, on August 21, 1964.

Economy of the Arctic villages. Government spending was the basis of the economy in the larger villages. In Barrow and Kotzebue Federal money was spent for construction and operation of Bureau of Indian Affairs schools, Alaska Native Service hospitals, military sites, and Alaska Communications System stations. In Barrow the Arctic Research Laboratory was used for scientific activities.

Scheduled airlines and bush air operations added to the real income and upgraded the standard of living by making goods available. Shipping, barging, and lightering continued to provide wage-earning opportunities.

Oil and mineral exploration brought money into many villages along the Arctic coast and inward. It was reported in August, 1964, that American and Canadian-British petroleum groups were contemplating the use of nuclear powered submarine tankers to move the oil directly from the fields north of the Brooks Range across the Arctic basin to European markets. Some geologists thought that the Arctic slope might have the greatest petroleum potential of any geological province within the United States.[3]

Hotels and restaurants were built to care for the people involved in the above activities. A soda fountain was installed in Barrow and barber chairs and beauty parlor equipment were acquired, awaiting qualified operators. Plans were being made in Barrow and Kotzebue for serve-yourself laundry and dry cleaning machines. It was not clear to the writer that a safe and dependable water supply could be provided for these activities. Natural gas was made available for the citizens of Barrow in the spring of 1965.

---

[3] Alaska Monthly Review of Business and Economic Conditions. College, Alaska: Institute of Business, Economic and Government Research, August, 1964. p. 4.

Paying jobs were more available for men than women. The women contributed in many ways to the hunting-fishing economy and prepared some items of clothing. However, the refined skin sewing, beadwork, and basketry were not found among the Arctic people as much as among the Interior natives.

Opportunities for female occupations were limited as shown by the following census report:

INDUSTRY GROUP OF EMPLOYED PERSONS, FEMALE 1960

	Barrow	Kobuk
Female	36	159
Agriculture, Forestry, and Fisheries	--	5
Manufacturing	--	5
Nondurable Goods (Incl. Not Spec. Mnfgd.)	--	5
Transportation, Communications, and Other Public Util.	4	8
Food and Dairy Products Stores	--	5
Eating and Drinking Places	5	15
Personal Services	--	34
Hospitals	17	29
Educational Services: Government	6	17
Other Professional and Related Services	4	3
Public Administration	--	14
Industry Not Reported	--	24

Money management problems were simple. More than half the families had only enough income for bare subsistence.

Family income in 1959 was as follows:

	Barrow	Kobuk
All families	260	598
Under $1,000	18	131
$1,000 to $1,999	63	148
$2,000 to $2,999	31	59
$3,000 to $3,999	24	78
$4,000 to $4,999	23	39
$5,000 to $5,999	23	45
$6,000 to $6,999	27	28
$7,000 to $7,999	8	22
$8,000 to $8,999	36	15
$9,000 to $9,999	--	--
$10,000 and over	--	12
Median Income: Families	$3,750	$2,339

Although the median income did not compare unfavorably with the national figures, it was important to be aware that the cost of living at that time was considerably higher than the national average. Inaccessibility, cold temperatures, and a permafrost condition made it impossible for even those with the highest incomes to maintain a way of life that had become standard for the average family in the main body of the United States. Fresh produce prices were a good illustration of this difference. In August, 1964, one could buy an aging head of lettuce in Barrow for $1.37 and a tube

of tomatoes for $1.20. The more accessible village of Kotzebue offered medium-sized oranges for twenty cents each. It must be remembered, however, that the Arctic people still relied heavily on birds, animals, and fish to supplement their food supply and that berries and greens still made an important contribution to native diets. The innovation of natural gas was expected to make a considerable saving in heating costs in Barrow.

According to Bureau of Indian Affairs figures, Alaska's 43,000 Indians, Eskimos, and Aleuts in fifty villages harvested 2,092,193 pounds of game animals and by-products in 1962. They showed that 10,028 people and 9,754 work dogs were dependent to some degree upon this food supply. In addition, during that year, these villages harvested 96,207 pounds of game birds, collected 670 dozen wild bird eggs, and gathered and consumed over 100,000 pounds of edible berries and plants. Furthermore, they caught and used 2,146,676 pounds of fish from fresh water and ocean, bringing the total of wild animal products consumed to 4,335,076 pounds in 1962.

Compared to the 430,000 pounds of reindeer meat produced in 1963, some of which went to outside markets, it was believed that more than 90 per cent of the animal products consumed by the native population in the northern villages was from fish and game.[4]

---

[4]Ibid., July, 1964. p. 5.

Women's employment. It must be remembered that the census figures could now show the whole picture. Not only was the work affected by the seasons, but also by the sporadic nature of many of the outside enterprises started in these communities. During the summer of 1964, for instance, there was more employment for women as more money was being spent in stores, eating places, and hotels. Construction of a hospital, school, and armory as well as the oil exploration made this possible. One government official estimated the female employment at that time to be seventy individuals. At the same time it was indicated that there were vacancies for female employment because of lack of trained women. The official predicted a 50 per cent projection in female workers required the following year. Everyone interviewed, men as well as women, expressed interest in the possibility of a beauty parlor's being installed and hoped that girls could be trained as beauticians.

Six girls interviewed who were working as waitresses in the eating places were students at Mt. Edgecumbe or the Bureau of Indian Affairs college at Lawrence, Kansas. It was obvious that the educated women in Barrow had an advantage over the others, even in the less-skilled jobs.

The welfare agent, a well-educated native woman of forty-eight who had given birth to her thirteenth child, suggested that a day care center for children of working mothers was badly needed. She pointed out that girls needed more instruction in sewing and preparation for hospital aide jobs. She mentioned, as did every employer interviewed, that women needed the proper training for the things that they were already doing. One woman made a living by keeping the parkas of the men stationed at a nearby mili-

tary site in repair.

A non-native woman in a managerial position said that the residents of Barrow had a good understanding of money and what it will buy. She said that children of the village at that time were spending a total of $125.00 a day on candy. (This figure was not checked.) She also stated that it cost fourteen dollars to have a "load" of laundry done in Fairbanks. A girl in a hotel, she said, was now doing the same job in Barrow for two dollars, using cold water. She expressed dissatisfaction with the lack of professional attitudes by the local employees toward their jobs and said that several employers were considering bringing in help from "Outside" because of undependability of the local help and their lack of responsibility in sticking to a job or reporting in when they knew they would be absent. Although Barrow was a "dry" town, apparently liquor was brought in for private use and still constituted a problem for both men and women. The woman mentioned expressed concern over the fact that there was little or nothing for the girls just out of the eighth grade to do.

The local attitude toward regular work must be evaluated in the light of understanding the importance of hunting and fishing to the natives. The fact that game and fish could be acquired only at certain times made it necessary for the people to take advantage of these times. This did not always fit into the pattern of the currently accepted attitudes toward work habits.

Educational facilities. A high school was being built. Meanwhile, there were fifty girls attending secondary schools in other towns, according to a Bureau of Indian Affairs official.

Adult education conducted by the Bureau of Indian Affairs in Barrow

included the formal learning activities: reading, writing, arithmetic, spelling, grammar and conversation. Informal learning activities took the form of village meetings regarding planning of community projects: natural gas for Barrow, road construction, house moving, village cooperatives, housing projects and townsite and survey meetings.

One Barrow woman, a cardiac case, was receiving vocational rehabilitation under the program of the State Department of Education. There was no evidence of handicapped women working in the village.

The younger women interviewed were all interested in further education and the older women put great stock in more education for their children, not only for prestige, but for economic reasons. The majority of the women over twenty-five had an education of sixth grade or less.

Health services. The Alaska Native Service (ANS) hospital played an important part in the economy, as well as the physical well-being, of the community. At the time of the survey there were nine women working there at permanent jobs in food service, housekeeping, laundry, and as hospital aides and practical nurses. The technical staff and clerical help were trained people from "Outside". The non-technical employees ranged in age from twenty-three to forty-five and all except two had been working there less than three years. Two had been there for twenty years.

---

[5] Emil Kowalczyk, Adult Education In-Service Training Session, Fairbanks, Alaska, January 13-17, 1964. p. 23.

KOTZEBUE

Economy and geography. Kotzebue, located near the mouths of the Kobuk and Noatak Rivers, the chief trading center for that area, had a population in 1960 of 1,290, 86 per cent of whom were one-quarter or more Eskimo.

Business and governmental activity during the summer of 1964 gave the village an air of prosperity. However, 22 women were listed on the welfare rolls at that time, mostly for aid to dependent children.

An Air Force station three miles from town with a staff of eighty-five men and an Alaska National Guard unit, made up of native personnel, provided some income for the village.

The Federal government was represented in the community by: Federal Aviation Agency, Weather Bureau, Public Health Hospital, Public Health dentist, Federal Health and Welfare Office, Bureau of Indian Affairs School and Range Conservation Office, Alaska Communication System, Post Office, and White Alice. The State government maintained a Fish and Game office, State trooper, and Welfare officer.[6]

The types and numbers of businesses were as follows:[7]

Retail Stores - 8, oil company - 1, poultry farm - 1, marine freight - 1, construction - 1, airlines - 2, flying services - 4, cab companies - 4, hotels - 4, restaurants - 4, theatre - 1, dance halls - 2, coffee shops - 2, bank - 1, telephone company - 1, electric association - 1, amusement company - 1, water supply - 2, mining exploration - 1, auto repairs - 1.

A minority of the available workers were employed full time. The majority derived income from seasonal work, unemployment and welfare checks, trapping, fishing, and art-craft work. Hunting was mentioned as a source

---

[6] Kotzebue Community Survey, 1964. Prepared by BIA School Personnel. pp. 3-4.

[7] Ibid., p. 4.

of unearned income.[8]

The report listed the chief sources of employment as follows:[9]

a. Professional services
   Notably hospital and BIA school

b. Construction
   Seasonal

c. Wholesale and retail stores
   Provide steady employment

d. Service trade
   Primarily owner-operated

e. Tourism
   Summer

f. Mining
   Copper mine expected to provide steady employment

g. Fishing
   Floating cannery in the summer

h. Arts and crafts
   Ivory, jade carving, and native dances

i. Transportation and communication

There were three hotels, all small. The cost of living was 186 per cent, based upon Seattle as 100 per cent. Kotzebue's first self-service (and only) laundry opened in September of 1964. This included twelve automatic washers, four tri-load dryers, and two dry cleaning machines.

Educational facilities. The Bureau of Indian Affairs operated an elementary school and planned to open a high school in 1966. The latter was to include eleven classrooms, shops, home economics rooms, and a gymnasium. Meanwhile, eighty-four girls were attending high school away from

---

[8] Ibid., p. 4.

[9] Ibid., p. 5.

home---twelve at Chemawa, forty-two at Mt. Edgecumbe and thirty at Wrangell.

Enrollment and school population were:[10]

Elementary	375
BIA High School	25
Friends' High School	30

Four hundred of the students were classified as "native".

The Friends' High School had four women teachers, all of whom had been there less than four years.

The Bureau of Indian Affairs adult education program was taught by two teachers to twenty students. The curriculum was made up of remedial English and mathematics, regular classes in civics, mathematics, English, and various correspondence courses, according to the Bureau of Indian Affairs report.

There was a Roman Catholic kindergarten, but no day care center for children. The employers interviewed mentioned the need for well-trained persons to provide day care for working mothers' children.

Women's employment. An estimated ninety-four women were working in Kotzebue at such jobs as cooks, hotel maids, grocery store clerks, fish canners, nurses and related hospital jobs, and airline station managers. Some of the problems mentioned by employers were the lack of professional attitude toward a job, inadequate training, and drinking.

The Alaska Native Service Hospital, operated by the United States Department of Health and Welfare, hired forty-three women in an age range of eighteen to sixty years for the following positions:

---

[10] Ibid., p. 9.

Food Service Workers	6
Aides	14
Registered Nurses	11
Dental Assistants	1
Clerical Workers	5
Housekeepers and Laundry Workers	6

Two-thirds of these employees had been there less than three years. One had been on the staff since 1949.

Each hotel employed from five to eight women during the summer.

Candid comments regarding job opportunities for women follow:

Private employer: "What you people are trying to do is fine and I admire you very much for it, but it is of no use unless you can stop the drinking. They are no good for work when they get to drinking. If you gave them a choice between a bottle of whiskey and this building, they would take the whiskey. Any kind of training would help if it would keep them on the job."

(Kotzebue was a "dry" town at the time of the survey.)

Educator: "There would probably be a need for day care centers for teachers' children, but heating and room is the problem."

Educator's wife: "Maybe they would rather have someone come to their homes to take care of their children so they could do other work."

Oldtimer: "The main income here is welfare."

EDUCATION, EMPLOYMENT STATUS, AND SELECTED LABOR FORCE CHARACTERISTICS OF THE POPULATION, FEMALE, OF BARROW AND KOBUK ELECTION DISTRICTS

		Barrow	Kobuk*
Years of School Completed			
Female, 25 Years Old and Over		243	614
No School Years Completed		65	105
Elementary:	1 to 4 years	93	133
	5 and 6 years	33	164
	7 years	9	47
	8 years	16	85
High School:	1 to 3 years	--	14
	4 years	9	20
College	1 to 3 years	6	15
	4 years or more	12	31
Median School Years Completed		3.4	5.8

*The Kobuk election district included Ambler, Buckland (Elephant Point), Candle, Deering, Kiana, Kivalina, Kobuk, Kotzebue, Noatak, Noorvik, Point Hope, Selawik, and Shungnak.

AGE OF PERSONS IN LABOR FORCE, FEMALE

	Barrow	Kobuk
14 to 17 Years Old	--	14
18 to 24 Years Old	23	47
25 to 34 Years Old	24	49
35 to 44 Years Old	--	32
45 to 64 Years Old	16	36
65 Years Old and Over	--	9
Married Women in Labor Force Husband Present	36	98
Women in Labor Force with Own Children Under 6	32	63
Married, Husband Present	32	54

NOME

Economy and geography. Nome, a city of 2,316 people, was situated at 64° 30' N. and 165° 24' W. on the southwest coast of the Seward Peninsula on the Bering Sea in typical arctic terrain with the usual problems of permafrost, limited water supply, and flooding.

Nome had been an important gold mining center at the turn of the century; but in 1964, its economy was largely dependent upon tourism and government employment. Recent projects were: a water and sewer system, a vocational school, a Bureau of Indian Affairs student dormitory, an armory, and a Federal Building.

Nome was the center of an election district of 6,091 people in 1960. Village populations were:

Diomede	88	Savoonga	299
Elim	145	Shaktoolik	187
Gambell	358	Shishmaref	217
Golovin	59	Stebbins	158
King Island	66	Teller	217
Koyuk	129	Teller Mission	77
Mekoryuk	242	Unalakleet	574
Nome	2,316	Wales	128
St. Michael	205	White Mountain	151

Tourist items of jade, ivory, and fur sold fairly well, although traders had difficulty providing a steady and standarized supply. The Nome Skin Sewers Cooperative Association whose members had developed a reputation for the production of fine fur garments had closed. One reason given was that the woman who had been the leader was no longer able to continue working

and no one was prepared to take her place.

Year-around work was found with the airlines, stores, bars, restaurants, hotels, and other service industries. Mining and freighting provided some jobs during the summer. The 1960 census figures showed that family income was extremely low for 1,166 families in 1959.

For several years natives had been moving in to Nome from villages, adding to the number of unskilled employable persons. The case of the King Island Eskimos who had come in from a rocky island in the Bering Sea to find employment and improve living conditions illustrated some of the problems encountered by the villagers.[11]

Although there was no commercial fishing in this area, many families depended upon catching their winter supply for personal use. The personal and economic habits of the natives living in Nome showed that they had become much more money orientated than their friends in the smaller villages. State and Bureau of Indian Affairs officials had been concerned with the lack of a basic economy in Nome since the waning of the gold mining industry.

Reindeer herding, which had been sponsored by the Bureau of Indian Affairs, with six or eight steady herders, showed some promise. A report to the Bureau of Indian Affairs by Arthur D. Little, Inc., pointed out that the Seward Peninsula was one of the two most favorable areas for reindeer grazing in the State. It suggested that the six herds existing in 1963 might be able to produce 800,000 pounds of meat by the end of a five-year phase. The report showed that 482,000 pounds of meat valued at $182,000 were already being consumed and that Nome, which used some 90,000 pounds,

---

[11] Tundra Times. October 5, 1964.

was the largest customer for reindeer meat and had an appropriate location for a canning plant.

The report recommended improvement in range management and animal husbandry practices to overcome such adverse factors as: the competition with other meats, dietary deficiencies which affected the health of the animals, warble fly infestation, and loss of animals to predators. In addition, there had been a history of failure by the herdsmen in carrying out a job that was incompatible with their established way of life.[12] It might be said, then, that the reindeer industry had not been successful since its introduction to Alaska and could not be depended upon to affect the employment outlook for women, at least for many years.

Besides filling job needs, the State Employment Service was involved in helping to set up Manpower Retraining programs.

Educational facilities. One building housed the elementary and high schools. The Nome Vocational School, four miles from town, was administered jointly by the State Department of Education through its Division of Vocational Education and the State Department of Labor through its Employment Security Division. It was planned to provide job training for 200 persons and in 1964-1965 was offering bush airfield maintenance, arts and crafts, small engine maintenance and repair, and highway engineering technology. Class offerings were based on research made through the Federal Office of Manpower, Automation and Training for a demonstration manpower program.[13]

[12]Arthur D. Little, Inc., An Evaluation of the Feasibility of Native Industry in Northwestern Alaska. Report to BIA, September, 1963. pp. 16-40.

[13]Tundra Times. June 22, 1964.

One concern was to provide basic education in reading, writing, and arithmetic and an understanding of the social structure of the modern world as well as training in skills.

Further educational opportunities for the native population of Nome were provided by the Bureau of Indian Affairs. Some of the trainees were enrolled in a special program at Fairbanks; others were going to school "Outside".

Of the seven girls who had been graduated from high school in Nome the preceding year, three were continuing their education---one at Alaska Methodist University; one at the University of Alaska; and one "Outside".

One home demonstration agent with the Extension Service of the United States Department of Agriculture covered an area along the coast from a few miles south of Unalakleet to Point Hope.

Health services. The Department of Health and Welfare was represented by nurses, a doctor, and a dentist. Besides caring for the ailing, they carried out a program of preventive medicine and health education concerned with purity of water supply, disposal of human waste, and control of contagious diseases. The latter was of great concern in this area for, as Rodahl pointed out, the infant mortality rate among the Eskimos was twice as high as that of the other states, and tuberculosis caused thirty times more deaths among the Eskimos than among the whites in America.[14]

A Methodist mission hospital in the town served the community. Natives requiring hospitalization or extended and specialized care could go to the Alaska Native Service hospital in Anchorage.

---

[14]Kaare Rodahl, M. D., The Last of the Few. New York, Evanston and London: Harper and Row, 1963.

Women's employment. The ever recurring theme of disinterest and undependability, drinking, and not showing up for work was woven into conversations of employers. One, who had recently purchased a business, was particularly bitter about the employment problem. Another, who had worked in the bush as well as in Nome, had adapted his operation to the ways of the people, seemingly to the satisfaction of both. Another, a newcomer, deplored the work attitudes as being "unreal".

A shop specializing in tourist trade had partially solved the problem by providing boxes of pre-cut materials and trim for slippers which were given to women who were known to do dependable work. This was particularly good for older women whose teeth were not in good condition to shape the mukluk or slipper sole, although this process was often done with pliers by the younger women.

Although business in Nome was considered slow, there was a demand for trained office workers, particularly typists. As in many other towns surveyed, the skilled job was often held by a non-native.

Some of the employers of women were:

Hospital	36
School	25
Curio Shop	7
Hotel-Restaurant	8

The hospital jobs were:

Registered Nurse	10	Housekeeper	2
Nurse's Aide	12	Secretary	4
Cafeteria	4	Physical Therapist	1
Laundry	2	Laboratory Technician	1

Governmental agencies and airlines provided office jobs. There was a good demand for baby-sitters and light housekeepers since many of the working women were between twenty and forty years of age, had small children at home, and there was no day care center for children of working mothers and no school lunch program.

An agent of the State Employment Service said that female employment was low at the time and that training for the following occupations would be helpful: domestic, clerical, food service, hospital, institutional child care, and hotel service. He pointed out that the dormitory for the students at the vocational school would provide additional employment. The cafeteria in that school was expected to provide steady employment for some women.

Talks with working women showed that most of them had worked on their present jobs less than two years. Many of them were unskilled and an observation of some of them at work showed their need for training.

The good skin sewers were, in most cases, women of forty or older. The younger native women were holding jobs in government offices, stores, and hotels, or in private homes.

OCCUPATION GROUP AND CLASS OF WORKER OF EMPLOYED PERSONS, FEMALE: 1960

NOME ELECTION DISTRICT

SAINT LAWRENCE ISLAND

Economy and geography. The island, lying thirty-eight miles southeast of Indian Point, Siberia, was about one hundred miles long and twenty miles wide, the largest island in the Bering Sea. Between 168° 45' and 171° 50' west longitude and 63° and 63° 38' north latitude, it was assailed by storms the year round, although extremely low temperatures were uncommon. Precipitation could be expected for 300 days of the year, but high winds prevented an accumulation of snow.

Sub-arctic, low growing plants, some of them edible, covered the island. Birds and animals of the land and sea provided food and materials for clothing. Sea mammals were perhaps a more important source, walrus and seal being most available. Waterfowl and their eggs were the main source of protein food during the summers. Cliffs along the island's edge and inland marshes were nesting places for auklets, sea gulls, cranes, loons, puffins, ducks, geese, and other birds.

Foxes and ground squirrels were indigenous to the island; however, the latter were not as popular for parkas as the seal. Reindeer had been introduced in 1900. This had been a successful operation and the herd had increased to several thousand in 1940, but at the time of this survey it was estimated that the herd numbered between 900 and 1,000 and grazed near Savoonga.

Subsistence activities, particularly the hunting of walrus and seal, still formed the backbone of the economy. Welfare and the sale of carved ivory, baleen products, handmade dolls, fur slippers, seal and fox skins, walrus ivory, and archaeological specimens, provided the main cash income.

Scheduled airline service brought passengers and mail to the island three times weekly.

Men were employed in the native stores, as airline agents, postmasters, school custodians, assistants in the Bureau of Indian Affairs education program, and as guides when a big game hunt was organized.

Women found jobs in the school lunch program, as baby sitters and occasionally as housekeepers, as saleswomen for beauty products, in a native-owned coffee shop, and in the post office. They also sold specimens that they dug from the ancient site and fur products which they made.

SAVOONGA

Economy and geography. Savoonga was on the north side of St. Lawrence Island, some fifty miles east of Gambell. The town was at the water's edge, accessible by a one and one-half mile walk from the airport through marshy tundra. During the summer water stood on the ground in the village, making it necessary to have board walks connecting the buildings. In the summer water was piped from a spring to an elevated tank in the center of the village. Typical tundra vegetation, including lichen, spread from the village edge to the low-lying hills in the center of the island. Savoonga was somewhat protected from the ocean storms, but appeared to have more of a drainage problem than the villages located on the beaches of coarse gravel.

A small point of land, into which a wind-protected "pillbox" had been built, was almost continuously occupied during the day by men and boys watching for birds and seals to shoot. High cliffs were used by waterfowl for nesting. Almost every house had from one to three birds, cleaned and plucked, hanging from a rack near the entrance. Fishing provided a variety to the summer diets, although none were caught for commercial trade.

Unearned income from hunting and fishing was important to the economy. Wage-earning opportunities were provided by several State and Federal jobs: postmaster, sanitation officer, and National Guard captain. Employment in airport construction had been available during the summer of 1964 for eight men, a small percentage of the total crew. Two men worked in the council-owned store.

The coming of the airplane to Savoonga (it was the last community

in Alaska to receive its mail by dogsled in the winter and umiak in the summer) may lead to a widening of the economic base; but at the time of the survey the building of a new schoolhouse and a road from the airstrip to the village were the only projects mentioned. These were expected to provide jobs for another summer.

Residents prided themselves on being good workers and managers. There were many indications of thrift and industry and good use of local resources.

Educational facilities. The Bureau of Indian Affairs teachers estimated that the ninety-seven pupil school would increase to 130 students five years hence. There were eight girls attending school "Outside"---seven at Chemawa and one at Mt. Edgecumbe. There were no adult classes. The council president mentioned receiving bulletins from the extension service and suggested that it would be good for the women to be taught canning.

Some men were attending the Nome Vocational School. One handicapped girl had been educated "Outside" and was trained for typing and sewing. However, there were no employment opportunities for her in the village, except as a part-time domestic.

Health services. The two nurse's aides took care of routine health matters. A dentist and a doctor from Nome, mentioned earlier, made occasional trips to Savoonga.

A village sanitation officer was paid to take the responsibility for the water supply and sewage disposal. The presence of an internal cyst-forming organism, *Echinococcus granulosus*, which was carried by dogs and transferred to humans by drinking water, made it necessary for each family to treat its water supply.

Dispensing health information was an important part of the teacher's job. A snack consisting of pilot bread, juice, and a vitamin pill was given the children during the morning recess.

As in Gambell, tuberculosis had been a real problem. Many of the women interviewed had spent a year or two in Alaska Native Service hospitals recovering from the disease.

Women's employment. Employed women were as follows: two nurse's aides, one teacher's aide, one domestic, and a Bureau of Indian Affairs teacher.

The airport construction superintendent arranged for the crew's laundry to be done by local women. The wife of the president of the village council handled it, dividing the work among fifteen women who did a creditable job in their own homes using irons heated on the stove.

Orders from the construction crews for dolls and other handicrafts kept the women busy who were skilled at sewing. One woman had made twenty parka-clad dolls that summer. Slippers, balls, and toy seals were popular items.

It should be mentioned that women were busy all day with family chores---carrying water, cleaning game, cooking, sewing, housecleaning, and helping to care for the dogs. The women interviewed seemed reluctant to make positive statements or to show interest in an activity that would interfere with the established routine of a woman's life. They looked to their husbands for help in answering the questions. The wife of the council president evidently was a leader among the women and represented them well in contacts with outsiders. The women showed an interest in laundering, baking, nursing, and food handling.

Educational facilities. A couple taught the eight grades in a Bureau of Indian Affairs school with help of a native teacher aide. Five of the six girls who were graduated the preceding year had gone away to high school.

A native man was in charge of the adult education program and was searching for ways to meet the needs of the villagers. It was interesting to note that the only woman enrolled in the Nome Vocational School in September, 1964, was a Gambell resident in her fifties who had had two years of schooling.

Health services. A doctor and a dentist, under contract with the Department of Health, visited Gambell occasionally. There was no nurse in the village. Routine medical care was given by a nurse's aide, a native man trained for the job. Serious cases were usually sent to Nome or Anchorage.

Women's employment. Employment for women was limited. There was some indication that women did not put a realistic value on their time; they sometimes worked as domestics at a low hourly rate, and they sold well-made men's parkas for as low as $60. Many of the women tanned skins for family garments.

One woman had become interested in baking and had gained a fine reputation for her products. There was some discussion as to the feasibility of establishing a small bakery. Another woman earned several hundred dollars a year from her black-and-white drawings. Some of them had been copyrighted and transferred to household articles which appeared to be selling well.

Women showed consideration for their husbands' opinions as they discussed plans for money-making activities. They looked at their husbands

as if asking permission before answering questions and remarked that what they would do depended upon their husbands' attitudes. Some were shy and lacking in ideas for money-making activities for themselves. Upon suggestions from the interviewer, they indicated an interest in baking, laundry, and nursing.

The correlation between age and education for seven women interviewed was as follows:

AGE	YEARS OF SCHOOLING
57	2
50	0
48	4
37	4
37	6
30	7
20	8

A high value was placed on education, and adults showed that they felt that better jobs were available to those who could work with written words and numbers. Some remarked that their education had been limited because they had lived on another part of the island; others, that they had become sick and had had to quit school, or that their mother had died and they had left school to help the father rear younger children.

Several of the women had come over from Siberia as children. None of the married women interviewed indicated an interest in leaving the island permanently. There could have been a different feeling among the young, unmarried girls. Hughes, for instance, found that the inhabitants were interested in the stability and security of the white world and would be

willing to leave the island in order to share in a world characterized by power, material abundance, skill, cleverness, health, cleanliness, long life, enjoyment, excitement, and individual freedom.[15]

Many housewives were caring for semi-invalid or bedridden, elderly relatives. Tuberculosis was a problem for all ages. According to Hughes, during the period of 1940 to 1954 there were forty-nine deaths from this disease, representing a rate of 1,067 per 100,000 as compared with the United States rate in 1954 of 10.2 per 100,000. Thirty-one per cent of the deaths fell in the eleven to nineteen-year-old group. Fifty-three per cent of the population, not counting stillbirths, died before reaching twenty years of age.[16]

Civil Aeronautics Administration buildings, no longer used by that agency, had served in the 1960's as an inn, a trading center, and headquarters for walrus and polar bear hunting. A trader made some effort to encourage native industry by guiding the local people in making salable items and finding commercial outlets for them.

A Bureau of Indian Affairs program called for shipping 500 to 1,000 reindeer to St. Lawrence Island to be cared for by islanders for use as domestic food and food for the numerous sled dogs. This was to be done late in the summer of 1964, but the project had been delayed until the following year because of transportation problems.[17]

---

[15]Hughes, op. cit., p. 345.

[16]Ibid., p. 78.

[17]"Reindeer Shipment Plans Under Study", Anchorage Times, September 16, 1964.

Fur farming and hide tanning had been suggested for similar arctic villages, but research had indicated that this was technically feasible but economically unfeasible.

Lack of motivation, a tendency to rely upon the government, and the absence of a heritage of management experience were mentioned as impeding factors for this, as well as for the reindeer industry.[18]

DILLINGHAM

Economy and geography. This fishing village at 59° 02' N., 158° 33' W., had 424 inhabitants in 1960 and was the largest town in the Bristol Bay area. Canneries were kept busy during the height of the salmon run; but many of the workers were hired "Outside" so that the village during the off season did not reflect the income that had been realized there during the summer. Off-shore and bottom fishing were discussed, but had not developed as an industry as they had in similar locations fished by the Japanese and Russians. When the salmon run was poor, the village economy suffered drastically. At one time, Dillingham was designated to receive an allocation of surplus food from the Federal government.

State and Federal activities provided most of the steady jobs. An Alaska Native Service hospital at Kanakanak (about seven miles from Dillingham), a Fish and Wildlife Office, and the public schools were the main governmental facilities.

Dillingham was "wet" and had several liquor stores and bars. The town had been recently incorporated and activities related to water supply and sewage disposal were providing jobs for men.

Educational facilities. A public high school and elementary school and two parochial schools were operating in 1964-1965. There were no day care facilities nor adult education classes being held at the time of the research.

Health services. The Alaska Native Service hospital at Kanakanak took care of the medical needs of the native population. For the others, there was a station for a public health nurse in Dillingham.

Employment for women. Canneries, the largest employers of women,

hired for forty-five days with a guarantee of $864.44, $736.71, or $694.77 depending on job classification. No previous training was necessary for the operators, although frequently women would work up from a Class B, or low-skill job, to Class A.

Other Bristol Bay canneries hired more people than those in Dillingham, but fewer women. These were in places where the housing situation would have been complicated by the presence of women, an employer said. Some women were brought in from "Outside" for work in canneries or to serve as waitresses. A Dillingham fisherman said that it was very important to develop off-shore fishing to provide more year-around income. The costliness of gear and freezer ships appeared to deter development of bottom fishing.

Two hotels and several restaurants provided steady employment for several women. Most of them had worked at their jobs for less than three years. They ranged in age from eighteen to fifty. An employer mentioned undependability because of drinking or temperament as the largest employee problem.

Trained secretarial help was scarce. The city needed an experienced bookkeeper. Every employer who was asked about the need for a day care center replied that one was badly needed. The school hired a physically handicapped woman and several crippled women were hired in the cannery for labeling and marking cases. The Alaska Native Service hospital at nearby Kanakanak provided a source of employment for women in the area.

TYPICAL WOMEN'S EMPLOYMENT IN DILLINGHAM, 1964

Cannery (Summer only)	
Canning and related	30
Food service	8
Laundry	1
Housekeeper	1
Public School	8
Fish and Wildlife	2
City Administration	2
Airline	2
Hotel and Restaurant	8
Retail Establishment	3

BETHEL

Economy and geography. Bethel, with 1,258 people, was the transportation center for the lower Kuskokwim and the Bering Sea coast from Hooper Bay to Eek, including Nunivak Island. It had an airstrip which accommodated bush aircraft and prop-jets. The river served as a base for float plane operations. It was possible to bring in large supplies by ship, tug, and barge. The reindeer and musk oxen range on nearby Nunivak Island affected some of the traffic and supplies going through Bethel.

Salmon fishing, particularly for kings, provided income and subsistence activities. Bethel supplied some laborers for canneries in the Bristol Bay area and others worked at the king salmon plant in town. Governmental activities---Federal Aviation Agency, Bureau of Indian Affairs, Alaska Native Service, State schools, and the United States Weather Bureau---accounted for most of the salaried income.

Industry was hampered by the shortage of a pure water supply and adequate methods for sewage disposal. Water sold for two and one-half cents or three and one-half cents per gallon, according to the amount bought at one time, which could amount to twelve and one-half cents or seventeen and one-half cents every time a toilet was flushed.

Educational facilities. The State had a school building for elementary and secondary students and a kindergarten program was offered.

For the outlying area, according to Bureau of Indian Affairs figures, there were 102 girls attending high school elsewhere, plus ten studying at Haskell, and two in art school "Outside". Twelve others were taking

part in the Bureau of Indian Affairs' Employment Assistance Program

In the villages under the Bethel Bureau of Indian Affairs Education Office's jurisdiction were thirty-two elementary schools. These hired, in addition to the male teachers, forty-six women. Thirty-two other women worked in the school lunch program which was offered in each school.

One official pointed out the correlation between age and education. Women older than forty could be expected to have a second or third grade education; twenty to thirty years old, sixth to eighth grade; and eighteen to nineteen year olds, at least eighth. Census figures correlating age and education bear this out.

Health services. There was a doctor at the time of the survey, a woman who had previously been with the Alaska Native Service hospital. There was also a half-time public health nurse.

The Alaska Native Service hospital on the outskirts of town, provided health services for the native population in Bethel and up the Kuskokwim River. Staff doctors took turns in the field, going out for a week at a time and traveling by air and by dogsled for the shorter trips between villages.

Women's employment. Native girls hired by the stores and offices were those who had been trained in office work or had had other secondary schooling. Non-native women, many of whose husbands had government jobs in town, filled some of the positions. The need for well-trained secretarial help was frequently mentioned by employers. There were at least four unfilled secretarial positions in early September, 1964.

One general store hired six women; another, three. A restaurant-hotel employed six women; the Bureau of Indian Affairs office, twelve, all clerical.

Twenty women worked in the cannery during the summer. The State school hired thirteen women as teachers and two as office workers. One woman was working for an airline.

The largest single employer of women in the town was the Alaska Native Service hospital, which used them for the following jobs:

Registered nurses	10
Practical nurses	9
Nursing aides	11
Food service	5
Dietician	1
Director of nurses	1
Assistant director of nurses	1
Educational services	2
Laundry	2
Seamstress	1
Clerical	7
Housekeeping	4
Total	54

These women ranged in age from nineteen to fifty-eight years.

One employer remarked that undependability of the employee in reporting for work was his biggest problem with labor. Another said that a day care center was needed.

Only two employed physically handicapped women were brought to the writer's attention. One suffered a speech defect; the other, deafness. Tuberculosis, orthopedic problems, and accidental crippling accounted for the majority of the handicapped. Accidental crippling occurred more fre-

quently among men than women.

One isolated village had an unusual amount of mental retardation. One official thought it was due to intermarriage. This was not checked.

ANIAK

Aniak was a village of 308 people in 1960, according to United States census figures. It was about eighty miles up river from Bethel. There was a Federal Aviation Agency station there and a small inn and restaurant on the airstrip's edge.

There was little in the way of employment for women. An inn had hired one or two, and occasionally some found jobs as domestics for the Federal Aviation people.

This village, as were many places along the river, was constantly threatened by spring and summer floods.

The economy was largely based on subsistence activities.

STONY RIVER

Economy and geography. In 1964 there were 114 people living at Stony River, located on a seven-mile-long island at the junction of the Stony and Kuskokwim Rivers above Bethel. There was an airstrip suitable for bush plane landings, a coffee shop, a trading post, a sawmill, and a small industry in manufacturing prefabricated cabins. Some of these buildings were shipped down river as far as Bethel.

Educational facilities. A two-room, State-operated school had an enrollment of twenty-seven students during 1964-1965.

Health services. A Public Health Service dentist lived in the village and provided dental care for the villagers of the lower Kuskokwim. Routine and non-professional health care and record-keeping were done by his wife. A training program had been started whereby the village councils paid the fare for one or two of their people to go to the hospital at Bethel for a six-week training course in health services. Their room and board were provided by the Public Health Service while they were learning.

Women's employment. The few available jobs in the village usually went to those with the education for record-keeping related to the job and with the self-discipline necessary to meet the schedule.

ESKIMO VILLAGES

Summary

Since the purchase of Alaska a century ago, the Eskimo people and their problems had been a subject of interest to American anthropologists, sociologists, physiologists, and economists. Their ancient villages had been excavated, their health problems studied; they had been weighed and measured, their basal metabolism had been tested, their food habits analyzed, their family life and interpersonal relationships observed, their psyche had been probed, and their mode of subsistence reported.

There appeared to be agreement on the fact that the Eskimo had demonstrated an almost perfect adaptation to his physical environment, shown by his ingenuity in utilizing available resources.

The cause of concern had been that of acculturation to a society suddenly thrust upon him. The influence of outsiders, particularly during and since World War II, was so disruptive to the old way of life, which was primarily a nomadic, hunting existence, that some seemingly insurmountable problems arose.

Although the Eskimo's activities became more dollar-directed, survival in the harsh environment still demanded that he carry on a cycle of activities to fit the seasons.

The criticism by newcomers to the Arctic of his undependability as a worker were perhaps valid from the employer's point of view. It had to be recognized, though, that a people long-accustomed to depending upon nature to provide for their very subsistence could justifiably be reluctant to make a complete change in their way of life and to come to depend

upon the fluctuating economy of the newcomers to provide for their survival on the Arctic coastal plains.

The most successful employers appeared to be those who could and would allow the native men and women to fit their hunting and fishing activities into the employer's schedule, with an understanding as to limitations. These were usually the businessmen who offered strong, dependable, and effective leadership in their community.

Human behavior, it was recognized, was not easily understood, and it would have been presumptuous for this researcher to suggest that any program of education could provide all the answers to the individual's personal problems related to employment.

Poor money management, personality and family maladjustments, and the misuse of alcohol, whether the town was legally "wet" or "dry", were serious problems and were the concern of many agencies.

At the conclusion of the work, during which the villages were surveyed and people interviewed in their homes and at work, the following recommendations were made relating to the place of vocational education in training women for job opportunities.

ESKIMO VILLAGES

Conclusions:

1. The Eskimo race in Alaska is increasing and more young Eskimos are remaining in and returning to the villages than are moving away permanently.
2. The basic economy of the Eskimo is based upon subsistence activities and the women play an important part in these activities.
3. The role of the woman in the Eskimo village indicates that for many training for part-time or piece work would be more practical than for full-time employment.
4. The Bureau of Indian Affairs can and does provide vocational training for young women who want to work at jobs other than those available in the villages.
5. Less than two per cent of the female Eskimo population regularly receive Aid to Dependent Children or Old Age Assistance.
6. The development of the native industries (fur farming, tanning, and reindeer herding) is technically feasible, but economically unfeasible.
7. Eskimo women trained in health education could earn money as nurse's aides and at the same time contribute substantially to the welfare of their community.
8. Wives of government workers who are stationed in villages are holding office jobs that could be done by trained Eskimo women.
9. Development of adequate water and sewage systems by the proper authorities could add to women's employment opportunities by making it possible to install laundromats, beauty parlors, coffee

shops, bakeries, and other industries using large supplies of water and requiring good waste disposal systems.

10. There is a need for training women to produce high quality, standardized fur products for which there is already a consistent market.

11. Eskimo men are not averse to employment for their women as long as it follows accepted patterns for women's activities.

12. Only the women in their twenties or younger can be expected to have an eighth grade education.

13. Eskimo women in the smaller villages do not place a high money value on their work and may be underpaid for goods and services.

ESKIMO VILLAGES

Recommendations:

1. The Division of Vocational Education, Department of Education, should provide job training for women.
2. The programs should be chosen with due consideration for other vocational training in effect, such as those of the Manpower Development and Training Act or the Bureau of Indian Affairs.
3. Vocational counseling should be given in the seventh and eighth grades.
4. Pilot training programs should be introduced in the fields of health education, food handling, hotel services, and clothing construction using highly qualified instructors who are familiar with Eskimo culture.
5. Programs offered should, where possible, be in areas that would allow the individuals to remain in their own villages if they so desire.
6. Training programs should be based on surveys of the village, taking into consideration the psychology, sociology, and previous training of the inhabitants, as well as present and projected businesses and industries that would affect women's work opportunities.
7. Local inhabitants who qualify should be given the first opportunity for jobs.
8. Each training program should include indoctrination to instill high standards, pride in workmanship, and a professional attitude toward the job.

9. Women should be helped to realize the worth of their work and the value of their time.

10. Money management courses should be offered for all adult women in the community.

11. Certificates should be issued at the completion of definite occupational training programs upon evidence that the people have developed the skills and understanding necessary to qualify as trained employees for that occupation.

12. Every village that provides a substantial amount of employment for women should have a State-supervised day care center for the children of the working mothers, if a private day care arrangement with trained help and reasonable prices is not available.

13. There should be closer coordination among governmental agencies serving the needs of the Eskimos.

14. Eskimos should be helped to maintain a pride of their own culture.

CHAPTER IV

FAIRBANKS

Economy and geography. Fairbanks, on the Chena River in the Tanana Valley, 150 miles south of the Arctic Circle, at 147° 44' W., 64° 50' N., was the second largest city in Alaska. Towns in the election district and their populations were as follows in 1960:

Aurora	293
College	1,755
Dot Lake	56
Ester	81
Fairbanks	13,311
Graehl-Hamilton Acres	2,162
Island	659
Lemeta-Johnston	1,227
Northway	196
South Bjerremark	231
Tanacross	102
Tetlin	122
Tok	129

Although Fairbanks had extremely low temperatures in the winter, the long, warm summer days made it possible to grow some commercial crops such as potatoes, cabbage, and grain. Dairying had become well established. The discovery of gold in 1902 gave Fairbanks its start, but played a minimal role in the community's economy after 1920.

The Alaska Railroad connected Fairbanks with Anchorage, 365 miles to

the south. A road from Valdez made trucking possible from that seaport to the Interior. The Alaskan Highway was an important link to the main body of the United States through Canada. As in most Alaskan cities, air travel increased greatly after World War II. Bush flying to the remote Interior and Arctic Coast accounted for much of Fairbanks' airlines business.

An Army base, Fort Wainwright, on the outskirts of town, and Eielson Air Force Base and Fort Greely to the south, affected Fairbanks trade.

Indians from the interior valleys and Eskimos from the coast were drawn to the metropolitan center for employment, but the move was not always successful economically nor culturally.

Strong industries in December, 1964, were government, transportation, communication, and utilities. At that time, the unemployment rate was 6.9 per cent.[1] In mid-August, 1964, it was 3.7 per cent.[2]

Educational facilities. The North Star Borough School District had a 1,523-student high school with eighty-two teachers; six elementary schools, including kindergartens; and a junior high school. There was a program for special education for the handicapped. The high school offered vocational education courses and there were some work-study classes. A Catholic high school had 110 students and a faculty of eleven. Their grade school had nine teachers.

The district offered adult evening classes. Students were at least eighteen years old and were not enrolled in a regular, full-time day school

---

[1] Alaska Monthly Review of Business and Economic Conditions. March, 1965.

[2] Ibid., January, 1965.

pre-college program. The offerings related to domestic skills were described as follows:

Foods: Designed to teach preparation of foods--appetizers, canapes, hors d'oeuvres.

Flower arranging: How to arrange flowers according to need--decoration type of flower.

Interior design: A basic course in principles of interior decoration based upon color and fabric selection, room planning.

Millinery: Basic millinery--new hats for the Easter season.

Knitting: Beginning and advanced instruction.

Sewing I and II: Fabrics, patterns, cutting and sewing; designed to teach clothing construction; alterations, buttonholes, and pleating.

These were offered for different lengths of time, ranging from five weeks to eight weeks, usually meeting for two hours two days a week. The fees were from seven and one-half dollars for the shorter courses to twenty dollars for the longer ones.

The University of Alaska was experimenting, through its extension service, with a three-month course in homemaking to train women to qualify as professional homemakers to manage households with children in the absence of the mother. A professional home economist was teaching the course, using guest lecturers to teach nutrition, home management, credit, child care, and sewing. In April, 1965, sixteen women were enrolled. Some were new to Alaska, others had recently moved to Fairbanks from northern villages.

The University of Alaska had opened as a Land-Grant college in 1922 and was designated as the University of Alaska in 1935. It covered 2,250 acres and had an enrollment in 1964-1965 of 1,416 on-campus students (during the first semester).[3] It was approved by the Federal Office of Vocational

---

[3] University of Alaska Catalog 1965-1966, College, Alaska. p. 28.

Education for teacher training in Vocational Home Economics.

The minimum requirements for a bachelor of science in home economics were 130 credits. The 1964-1965 University catalog stated that the course in home economics was designed primarily to train the student for marriage and family life. It also stated that by proper selection of courses, graduates were enabled to find employment in related vocations. Home economics courses were: meal management, college orientation, related art, textiles, advanced clothing, family health, home management, clothing construction and selection, marriage and family life, advanced foods, nutrition, child development, house planning and furnishing, and home management residence.[4]

The summer session for 1965 offered no home economics courses on campus or in Fairbanks. An evening class program for 1964-1965 listed a marriage and family life class that could be taken on the main campus, at Fort Wainwright or in other parts of the State where there were extension courses.

Health services. A seventy-bed hospital, used by fourteen doctors, was operated by the Sisters of Providence.

Employment for women. During the month of April, 1965, these requests were made for women employees:[5]

Contract Construction	4	Service Industry, Except Private	13
Public Utilities	6	Private Household	31
Wholesale and Retail Trade	18	Federal Government	3
Finance and Insurance	9	State Government	2

---

[4]University of Alaska Catalog 1964-1965, College, Alaska. p. 69.

[5]Figures supplied from State Employment Office, Fairbanks, Alaska, April, 1965.

Businesses in Fairbanks related to domestic skills and services were:

Alterationists	2	Furniture Dealers	3
Beauty Parlors	17	Grocers	12
Catering	1	Interior Decorators	1
Children's Clothing Stores	4	Laundries	1
Women's Clothing Stores	3	Self-service Laundries	6
Cosmetic Shops	2	Motels	5
Department Stores	2	Nurseries, Licensed	1
Drapery Shop	1	Restaurants	17
Drugstores	5	Sewing Center	1

In 1959 one-fourth of the working women were employed in eating and drinking places, personal service, or hospital work. This fact, in addition to that of the demand for private household workers as indicated by the requests to the employment office, showed that there were a significant number of openings for skilled domestics and service workers. Salaries were comparable to those of food service workers or retail trade clerks, but the low status associated with the job apparently caused many women to avoid this kind of work. Some people involved in placement said that employers needed training in employee relationships to make the jobs more desirable.

CHAPTER V

FORT YUKON

Economy and geography. This village of some 650 people on the Yukon River, eight miles north of the Arctic Circle and 125 miles northeast of Fairbanks had been established as a trading center for furs by the Hudson's Bay Company, and later was the site for an Episcopalian mission and hospital. The activities of these agencies gave the isolated village a permanency that continued long after the fur-bearing animals were depleted and the Federal government assumed responsibility for medical treatment of the natives.

A White Alice site helped the economy, but not as much as the villagers had hoped. The site employees' most obvious contribution to village income was the purchase of native beadwork. The science and technology involved in maintaining the site contrasted sharply with the simple village life.

The people of Fort Yukon were plagued by many problems: an expensive supply of pure water, limited sewage disposal facilities, high prices for basic commodities, threat of flood and erosion, distant source of medical care, absence of work opportunities, low educational level of adults, and the emotional disintegration and social problems related to poverty, i.e. drinking, poor personal management, and trouble with law enforcement agencies. Many families were crowded in small, sod-roofed log dwellings. A great deal of time was involved in subsistence activities---hauling wood, carrying water, fishing for personal use in unproductive waters.

Work opportunities were related to the school, airlines, trading outlets, utilities, and lodge. Trapping and fur selling still provided money income.

Businesses included a coffee shop, a small movie house, a lodge and restaurant, two stores, a family-run bakery, an oil dealer, and a supplier for electricity.

Fairbanks offered opportunities to earn money and to "get ahead", but going there to work was sometimes an expensive undertaking. For a man to rent a room and eat out, or to rent an apartment and take his wife and children there, to join a union, to buy special work clothes or tools, and to enter into any of the social life offered by the city sometimes made it economically unfeasible for the people of Fort Yukon to go there to work.

The village was nominally "dry", but everyone interviewed mentioned drinking as being a real problem. The ready access to liquor in Fairbanks may have affected the natives' ability to adapt successfully to urban life and have caused many of the villagers to return home disillusioned.

The women and girls who might have found work in offices or households in the larger towns had the disadvantage of being virtually untrained for the work available. The fifty-one-student high school, housed in a clean, modern attractive building offered no home economics, office, or shop classes. The students were taught music, English, social studies, mathematics, and science.

It was not part of the cultural pattern for mothers to teach their daughters the domestic skills. Living conditions were so simple that there was very little housekeeping that could be taught which might help the girls find jobs as domestics in homes with modern appliances and interiors.

Leather used for skin sewing and beadwork was purchased from local traders or "Outside" suppliers. A complaint was made that commercial skins

were too expensive, but that the hunters did not bother to save hides anymore.[1]

Most of the homes had electricity for lights. Although there were complaints about the price, it was a popular addition to the home.

Family money problems were easily analyzed. There just wasn't enough income. Of the 179 families having an income in 1959, 126 had less than $3,000 a year. Any beyond that amount necessary for bare survival was often spent on materials that brought immediate gratification: sweets, baked goods, liquor, and coffee.

It was not customary for women to sew for their children, although there were several households with sewing machines. Local stores and catalog houses provided sources for ready-made garments. The main requirement was that the clothing should be warm and that it should be cheap. Launderability was not a determining factor in purchases since there was no dry cleaning establishment and laundry facilities were limited or absent in most homes.

Women's work, as in many Alaskan villages, was monotonous and difficult because of the unhandy method of getting water and fuel and the lack of sanitary facilities, as well as crowded housing conditions. Since the men were more often unemployed than employed, they spent a great deal of time at home, thus adding to the burden of the housewife's work.

Considering all the factors that limited the money-making ability of the villagers, it appeared that any program of training for wage-earning occupations would be an improvement. Such a program would have to be

---

[1]"Fort Yukon Woman Changes Moose Hide to Work of Art", Fairbanks Daily News-Miner, April 21, 1965.

realistically based upon the culture, history, and future plans of the community and should take care of the needs of the in-school youth as well as those who had terminated.

A survey made in the spring of 1965 by a Long-Range Planning Committee of the City Council showed that the women were interested in training for child care, housekeeping, secretarial work, nursing, sewing, cooking (particularly baking), and laundry work.

Hospitalization for the seriously ill was provided at the Alaska Native Service facility in Tanana located many miles away. A public health nurse was usually stationed at Fort Yukon, but the people complained about not having a hospital.

A Community Action Program was being organized. Operation Headstart for disadvantaged children was underway for the summer of 1965.

The possibility of Rampart Dam's being built should be considered in long-range plans for the village.

CHAPTER VI

McGRATH

Economy and geography. McGrath, at 62° 58' N., 155° 38' W., with a population of 241, was about halfway between Bethel and Fairbanks by air and nearly 350 miles northwest of Anchorage. It had prospered as a trading and freighting center during the peak of gold mining activity in the Folger and Ophir districts and was still the most important trading center in that remote area.

A Federal Aviation Agency station, a post office, and a State elementary school provided most of the salaried income. Other year-around work was provided by two airlines offices, a cafe, two stores, and three bars. Transportation (there were two freight lines on the river), food service, lodging, general merchandising, trapping, and woodcutting were the main businesses.

School and Federal Aviation Agency construction were providing employment for men during the summer of 1964. The inn was full and the restaurant was doing a good business. There was no evidence of plans for further industry.

McGrath had several older residents who had stayed on after mining activities had diminished. Many of the homes were well built in the old Scandinavian style, and vegetable gardens were common.

Educational facilities. A new elementary school was being built in 1964. Three teachers handled the eight grades. Beyond elementary, some students went to Copper Center Catholic High School, others to Bureau of Indian Affairs schools, and still others made arrangements to attend secondary schools in other towns. Of the four eighth grade graduates during the

preceding year, all had gone on to high school.

Health services. A public health nurse was stationed there. Natives were eligible for medical care at the Alaska Native Service hospital in Anchorage.

Women's employment. Other than one store, owned by an "Outside" company, all the stores, bars, the eating place, and inn were owner operated. The post office employed two women and an airline hired one. There were two women teachers.

One family-run establishment employed a cleaning woman, a waitress, and a cook. The mother and daughter both indicated an interest in education for job training. Neither had finished high school and both expressed dissatisfaction with their present work.

Another woman, born in the area, served as welfare agent, assisted in health activities, and worked at cleaning and odd jobs. Her daughter, who had attended secondary school away, was assistant postmistress. Another daughter had taken the practical nursing program in Anchorage and was working and studying in Sitka.

A Federal Aviation Agency station was on one end of town and the families there sometimes hired women for domestic help. Residents remarked that the Federal Aviation Agency wives as a rule did not become involved in village affairs.

CHAPTER VII

TYONEK

This fishing village with 180 residents on Cook Inlet, fifty miles west of Anchorage, had a community hall, a cooperative store, and a fifty-one-pupil Bureau of Indian Affairs school. Transportation to towns across the Inlet was by private boat or chartered plane. A graveled airstrip for small planes was within walking distance of the village. The economy had always been dependent upon the fishing season, but recent oil exploration had brought business to the community and discoveries on Indian land had led to a settlement of several million dollars to the natives for their oil rights. A council was administering the income so that all the inhabitants could benefit. Long-term investments in real estate in Anchorage were included in their plans. Sixty-two family dwellings were under construction during the summer of 1965, providing employment for some of the men.

The school was to be transferred to a borough, and three classrooms were being built in 1965, eliminating the necessity for operating shifts. One village leader felt that the lack of facilities had been responsible for some students not being accepted in high school. Six students attended Mt. Edgecumbe in 1964-1965.

Changes in the economic situation in Tyonek promised to be interesting, since these people who had been living a partially subsistent life on marginal income had suddenly achieved some affluence. That there would be social and emotional effects appeared obvious. How they would adapt to the changes would make an interesting study.

CHAPTER VIII

ANCHORAGE

Economy and geography. The city, with 44,327 people, was the center of trade and transportation for the Anchorage election district, population 93,902, as well as much of interior and southwestern Alaska. Located at 61° 14' N. and 149° 54' W., on the eastern side of Cook Inlet between Turnagain and Knik Arms, the town covered some 40,000 acres from the bluffs of the Inlet to the foothills of the 8,000-foot Chugach Range. Two military reservations, Elmendorf Air Force Base to the northeast and Fort Richardson on the east, were contiguous to the greater Anchorage area.

Yearly average rainfall was slightly over fourteen inches and the annual snowfall sixty inches. Most of the snow fell from November through January and there was seldom more than sixteen inches on the ground at any time.

Maximum weather conditions were: record high, eighty-six degrees Fahrenheit; record low, minus thirty-eight degrees Fahrenheit; maximum monthly snow fall, forty-eight and five-tenths inches. The greatest amount of rain was expected between the beginning of July and the end of September. The growing season averaged one hundred days, with the longest days having a maximum daylight of nineteen and one-half hours. The shortest day provided five hours and twenty-eight minutes of daylight.[1]

Railroading was responsible for the birth of the city in 1915 and remained by far the most important business until the coming of World War II

---

[1]United States Weather Bureau.

501 48

when defense activities provided jobs for thousands. The discovery of gas and oil in the 1960's brought more business to this largest Alaskan city. Still, governmental activities provided over two and one-half times as much employment in Anchorage as any other one industry in August, 1964.[2]

During the 1960's, Anchorage earned a reputation as "the air crossroads of the world". Three domestic airlines scheduled flights to the other states; three others served the Alaskan interior and western coast; four carriers took passengers to Europe or the Orient; and four others used the airport for refueling, maintenance, and crew changes.

The total in-out air passengers for 1963 was 306,693, and the total through passengers 171,763. In and out freight came to 43,057,484 pounds.[3] Housing, feeding, and other services for the crews and tourists provided business for the community. A 450-room hotel was completed in 1964, and another with 150 rooms was opened in the spring of 1965. Some thirty other hotels and motels were operating at the time of the survey.

During the summer of 1962, 25,000 tourists passed through Anchorage on business or pleasure. Of that number, 4,800-5,000 came on planned tours.[4] Big game hunts, ski facilities, night clubs, and guided bus tours as well as sport fishing provided entertainment for the tourists and employment for the citizenry. Businesses in the city offered services comparable to those in any town of the same size in other sections of the

---

[2]Alaska Monthly Review of Business and Economic Conditions. September, 1964. p. 8.

[3]Anchorage Chamber of Commerce Report, Anchorage International Airport. October, 1964.

[4]Ibid., p. 27.

United States.

Anchorage was primarily a working person's town with a notable absence of a leisure class. Of the total number of employable persons fourteen years old and over, 45 per cent were employed. There were 17,183 women over fourteen years of age not in the labor force and 12,631 were working at the time of the 1960 census.[5]

"Mobile" was the word that could best describe the Anchorage employees. The men who came in to build the railroad were followed by the engineers and construction crews for military bases, highways, and airports and more recently by oil drillers and geologists. In 1960, 49.9 per cent of the persons living in southcentral Alaska had lived in another state in 1955.[6]

Service industries provided many work opportunities. Of 259 placements made by the Anchorage Employment Service during a period in 1962, one-fourth were in service: 29 in hospitals, doctors' offices, and other service establishments and 27 in private households as housekeepers, maids, or yardmen. Eighteen per cent found jobs in wholesale and retail trade and 14 per cent of the total were in service industry firms. Fifty-eight of these persons were placed in government jobs.[7]

Educational facilities. Under the administration of the Greater Anchorage Area Borough School Board, public schools started the 1964-1965 year with

[6]Ibid., p. 47.

[7]Anchorage Job Seekers Survey, Employment Security Division, Alaska Department of Labor, 1964. pp. 13-14.

an enrollment of more than 18,900 students between the first and twelfth grades.[8] Of this number, the Chugiak and Eagle River schools accounted for 1,080 and the Girdwood Elementary School for forty-five. There were twenty elementary schools, three junior high schools, and three high schools in the Anchorage district with a total certificated staff in 1964 of 820.[9] Forty per cent of the girls continued schooling after high school graduation.

The non-certificated staff in 1964 numbered 323. The school lunch program throughout the borough employed eighty-two women who served as cooks, bakers, managers, or office workers.

One supervising principal was in charge of special services which included the following faculty:[10]

Speech-Hearing Therapists	5
ANS Hospital Teachers	4
Teachers of Brain Damaged	5
Teachers of Mentally Retarded	12
Teachers of Physically Handicapped	1
Hearing Teachers	3
Visiting Teachers	2
School Nurses	14

Advanced study was available at the Anchorage Community College, the University of Alaska military base programs, and Alaska Methodist University.

---

[8] Facts Digest, 1964-1965, Greater Anchorage Area Borough School District, p. 7.

[9] Ibid., p. 10.

[10] Ibid., p. 8.

The Anchorage Community College of the University of Alaska was operated in cooperation with the Anchorage Borough School District. It was accredited as a part of the State University and offered the first two years of college academic work. On behalf of the School District, it offered terminal courses in general education, vocational-technical education, and continuing education for the adults of all ages in the greater Anchorage area.[11]

The enrollment in October, 1964, was 1,555. The college was approved by the Veteran's Administration under Public Law 550 for veterans desiring to attend college. Tuition assistance was available for members of the Armed Services under Public Law 413. Counseling services were offered and tests regarding ability, aptitude, personality, interest, and achievement were administered for a small fee to members of the student body requesting them. Apprenticeship classes were sponsored in cooperation with the Joint Apprenticeship Committees.

In June of 1964, a grant of $890,000 was given the Anchorage Community College for a multi-occupational project under Public Law 88-214 of the Manpower Development Training Act of 1963. Programs offered during 1964-1965 were based upon surveys made by the State Department of Labor and included: clerk-steno, clerk-typist, practical nursing, drafting, waitress, retail sales, airline reservations, food service, and health occupations.

Four private nursery-kindergartens and a Catholic Junior-Senior High School, grades seven to ten, were operating in 1964.

Alaska Methodist University, a four-year liberal arts college, had 349 students enrolled in full-time classes in the fall of 1964 and sixty-six

---

[11]Anchorage Community College, Catalog and Announcements, 1964-1965.

students in the night program. Expansion plans included a four-year nursing education program to make it possible for individuals to obtain all their training in Alaska. Classes in speedwriting, shorthand, secretarial training, business machines, real estate, and card punch instruction were offered by a private business college. Three accredited beauty colleges were attended by students from outlying towns as well as Anchorage.

Health services. There were two church-owned hospitals, two private nursing homes, and an Alaska Native Service Hospital. Providence Hospital (Catholic) had 150 beds; Presbyterian, 45; and the Alaska Native Service Hospital, 395.

The State had offices for public health, mental health, and a child study center. In addition, it operated a 225-bed Psychiatric Institution.

Women's employment. The high cost of living and a desire to improve the family's standard of living appeared to be the main incentives for women to work. In spite of improvement in shipping, increased competition among retail businesses, and greater efficiency in marketing, the cost of living in Anchorage was substantially higher than in the nearest "Outside" city, Seattle. According to the Bureau of Labor Statistics, the indexes of intercity differences in the cost of equivalent goods and services, with the cost in Seattle equaling one hundred, were as follows in October, 1963:[12]

Food	123	Apparel	111
Housing	135	Other Goods and Services	115
Rental Housing	172		

[12]United States Department of Labor, Bureau of Labor Statistics.

Of the 8,053 women with income in 1959, 2,192 earned less than $1,000 indicating that more than one-fourth of the working women in the Anchorage area were employed part time. Most of the women applying for jobs during the 1962 Employment Service survey had had high school educations or more. Those from twenty-one to thirty-four were the best educated. Of 413 applicants, 316 had twelve years' education.[13]

A survey had been made by the State employment Service for the purpose of acquiring information pertinent to setting up occupational courses for up to one thousand trainees who would come from Anchorage and other south-central Alaskan communities hardest hit by the quake as well as some from other parts of Alaska. The study indicated that there was a need for more trained waitresses, seamstresses, cooks, and other kitchen help such as salad makers and pantry girls. Counter girls were being trained in a small apprenticeship program. The Restaurant Employees' Union had sponsored a waitresses' course and a spokesman said that they might do so again.

Domestic help, particularly for child care or substitute mother, was in continual demand. Day care for children of working mothers was offered by an accredited nursery school for $80 per month. Classified advertisements in the two Anchorage papers on the same day in November, 1964, showed a need for:*

Private Household Workers	22	Waitress	1
Seamstress	1	Counter Saleswoman	1
Presser	1	Floral Designer	1

---

[13]Alaska Department of Labor, Employment Security Division, Anchorage Job Seekers Survey, July-October, 1962. p. 56.

*The Anchorage Times had notices for sixteen domestics; the Anchorage Daily News for 6. There may have been some overlapping.

According to a release by the Anchorage Chamber of Commerce, the wage rates for jobs ordinarily held by women as of August 1, 1963, were as follows:

TYPE OF JOB	GOVERNMENT	ALL OTHER INDUSTRY
Medical Technician	$475-577 Mo.	$350-500 Mo.
Nurse, General Duty	470-545 Mo.	400-450
Nurse, Office		375-425
Teacher, Grade & High School	558-705	550-750
Bank Teller		300-350
Bookkeeper	445-510	400-535
Cashier	3.02-3.28 Hr.	350-440 Mo.
Clerk-Typist	300-445 Mo.	350-450
Dental Assistant	370-428	350-420
Grocery Checker	1.71-3.19 Hr.	3.25-3.57 Hr.
Key Punch Operator	398-428 Mo.	400-450 Mo.
Receptionist	415-445	350-425
Salesperson, Clothing	1.62-3.28 Hr.	1.97-2.94 Hr.
Secretary	410-545	400-500 Mo.
Stenographer	406-480	350-455
Telephone Operator	390-420	20.00-23.25 shift
Stewardess		365-425
Child Monitor		1.00 Hr. or $25-$35 week
Day Worker		2.00 Hr.
Housekeeper		5.00 to 7.00 day or 150-220 Mo.

The foregoing figures were secured from the Alaska State Employment Service with the following note:

> These wage scales are largely based on starting salaries. They are based on a 40-hour week and do not include overtime rates, zone rates, supervisory or foreman rates, or any fringe benefits such as board and lodging. The Federal government rates include 25 per cent tax-free cost-of-living allowance on the government schedules.[14]

The telephone directory of June, 1965, listed privately-owned establishments who had work related to domestic skills:

TYPE OF BUSINESS	NUMBER OF ESTABLISHMENTS
Restaurants	68
Hotels and Motels	36
Women's Wearing Apparel, Retail	15
Cleaners and Laundromats	14
Furniture Upholsterers and Refinishers	10
Janitorial Services	11
Draperies	3
Sewing Centers	3
Interior Decorators	4
Dressmaking and Tailoring	4
Hospitals	3
Nurseries for Children	3
Bakeries	4
Diaper Service	1
Knitting	2
Confectioners	1
Department Stores	7
Home Furnishings	6

---

[14] Going Wage Rates of Various Employers, August 1, 1963: Anchorage Chamber of Commerce Paper.

One hospital hired the following in November, 1964:

Registered Nurses	65
Licensed Practical Nurses	12
Hospital Aides	61
Clerical	16
Secretaries	1
Administrators	1
Food Service	20
Technicians	12
Librarian	1
Housekeepers	7
Laundry Workers	8

In addition, there were seven Sisters: two in administration, three in nursing service, one in food service, and one in the pharmacy. It was remarked by an administrator that there was a high rate of turnover among the paid workers.

Alaska Psychiatric Institute hired many women. Jobs related to domestic skills were:

Cooks	6
Waitresses	10 (on-the-job training)
Kitchen Helper	4 (on-the-job training)
Housekeeping Aide II	2
Housekeeping Aide I	5 (on-the-job training)
Laundry Foreman	1
Laundry Worker II (Washman)	1
Laundry Worker II (Supervised) ironing and filling linen orders)	1

Laundry Worker I	6 (on-the-job training)
Seamstress	1
Planned additions:	
Kitchen Helper	2
Waitress	7

The following comments were made:

"Turnover is greatest among waitresses, nursing aides, and Nurse I."

"The shortage of practical nurses is particularly acute, and there is a continuous high percentage of vacancies in these positions. At present, [November 10, 1964] there are thirteen vacancies in fifty-seven budgeted positions, a not unusual circumstance."

CHAPTER IX

MATANUSKA VALLEY

Palmer and Wasilla

Economy and geography. The word "Matanuska" became associated with homesteading and farming in Alaska when the Federal government set up an agricultural colony there in the 1930's. It should be noted that there were some well-established communities, Knik and Wasilla, before the colonization. Palmer, at the upper end of Knik Arm on the Glenn Highway less than fifty miles northeast of Anchorage, was the trade center for the area in 1965. Paved roads led to Fairbanks and to Tok Junction from where they continued as the Alaska Highway. A railroad spur ran to Palmer; Wasilla was on the main line. An airstrip in Palmer was used by charter planes and private pilots. A small gravel airfield was located near Wasilla.

Dairy farming and other agricultural pursuits had been practiced since the Valley was first settled, but there had been many obstacles that prevented them from becoming as successful as many of the settlers had envisioned. Short seasons limited varieties of crops that could be grown to maturity; development costs ranged from sixty dollars to five hundred dollars an acre; regulations limiting the size of homesteads made some of them too small to operate as an economic unit; freight rates which made it possible to import milk and vegetables from "Outside" as cheaply as they could be produced in Alaska and high costs for farm labor made competition with stateside products difficult.

Since World War II, the population of the area had outgrown employment opportunities and many family heads had to find work in Anchorage or on

military bases. Johnson and Stanton mentioned in Matanuska Valley Memoir that after nearly twenty years, forty-nine couples of the 185 colonist families still lived in the Valley; seventy-seven couples had left Alaska; and that of the 130 men and women still living in Alaska in 1953, their occupations were as follows:

Housewife	47
Farmer	25
Laborer	11
Carpenter	10
Retail Clerk	5
Store Manager	4
Office Worker	3
Heavy Equipment Operator	3
Miner	2
Domestic	2
Miscellaneous*	13
Occupations Unknown	5

*One each of blacksmith, cafe operator, contractor, postmaster, bus driver, bricklayer, trapper, trucker, sawmill operator, plumber, telephone operator, bartender, and retired.[1]

Since 1960, Matanuska Valley had produced about 70 per cent of the total value of agricultural products in Alaska. There were 176 farms with 39,715 acres, of which 10,369 acres were harvested cropland and 1,221 cropland pasture.[2]

---

[1]Hugh A. Johnson and Keith L. Stanton, Matanuska Valley Memoir. Palmer, Alaska: University of Alaska, 1955. pp. 92-93.

[2]Alaska Monthly Review of Business and Economic Conditions, July, 1964. p. 2.

There were many State and Federal offices in Palmer. A partial list follows:

Agriculture Experiment Station

United States Geological Survey

United States Conservation Service

Farmers Home Administration

Alaska Communication System

State Division of Agriculture

Extension Service, U. S. Department of Agriculture

Alaska Department of Fish and Game

State Division of Roads

A paved road connected Palmer with Wasilla, twelve miles to the west, where some one hundred people lived in the village or on nearby farms. Summer tourists, sawmills, and dairy farming contributed to the economy, although most of the 'farmers' had to find work elsewhere.

Educational facilities. Three hundred and ten students attended Palmer High School and 135 went to Wasilla. Both offered vocational home economics. There were two elementary schools in Palmer and one in Wasilla. The Palmer Community College offered courses as interests warranted. During the spring of 1965, the following were scheduled: education (audio-visual), intermediate typing, advanced typing, shorthand, mathematics, psychology, education (principles and practices of guidance), ground school, drivers' education, and civil defense monitoring.

Twenty-seven of the thirty-three girls in the 1964 graduating class of Palmer High School continued their studies; two from Wasilla went on to college.

Health services. The public health nurse at Palmer covered the Valley. A community hospital for twenty-five patients was staffed and equipped for general medical care. Proximity to Anchorage made that town's hospitals and doctors readily available.

Women's employment. About fifteen women, including the school teachers, found work in Wasilla. The greatest need for trained help was said to be in food and hotel service and clerical work. Businesses in Palmer hiring women were:

Hospital	1
Hotel and Coffee Shops	2
Child Care Center	1
Department Stores	2
Seamstress	1
Washeteria and Cleaner	1
Dry Cleaner	1
Florist Shop	1
Beauty Parlors	3
Dress Shops	2

Many of these were small owner-operated establishments.

Palmer had a private child care center, but there was no public facility in the area.

WASILLA

Economy and geography. In 1916, railroad workers cleared a site for a camp between Lake Lucile and Wasilla Lake at 61° 35' N., 149° 26' W. In 1965, there were over a hundred permanent residents in or near the town and several hundred more who did some trading there. Although many lived on "farms", most heads of families earned a living at some other work. Coal mining, school teaching, retail sales, railroad work, and sawmills provided local employment. Summer tourist trade contributed to the economy. Improved roads had made Palmer and Anchorage more accessible so that many people drive there to trade or work.

Educational facilities. There were a grade school and a high school that offered vocational home economics. No adult education classes were being taught there in 1964-1965, but some residents took courses at the Palmer Community College. Of the seven girls who were graduated from high school in 1964, two went on to college.

Health services. The Palmer public health nurse served Wasilla, and tha community hospital in that town was available to all Valley residents.

Women's employment. The schools hired nine women teachers and two secretaries. About fifteen other women worked in or near the town. Occasionally there were openings for cooks and waitresses and clerical help.

WILLOW

Economy and geography. This community near the Susitna River, some thirty miles from Wasilla by railroad and highway, had formerly been an important freighting post for the miners in the Talkeetna Mountains. The railbelt in that area had long been a favorite with sport fishermen and had enjoyed more recent popularity for winter sports, particularly dog mushing. Trading posts, service stations, bars, general stores, cafes, and other tourist facilities had been built along the road and in the village.

Some of the homesteaders drove to Anchorage to work daily, while others stayed there during the week and returned home weekends. Requests were made in 1965 for a commuter train service to Anchorage for the benefit of those who were employed there. Some interviewees remarked that boredom and loneliness were an important problem with the women who sometimes had to live on the land to meet homestead requirements while the husband worked elsewhere. One suggested that a strong program of adult education during the winter could help to alleviate emotional problems as well as to provide training for wage-earning skills.

Willow was a favorite spot for military families to spend weekend vacations with their 'campers'. It was difficult to determine how much they contributed to the economy, since this arrangement often precluded purchases in the vacation area.

Besides the usual roadside businesses mentioned earlier, there were a washeteria, a hatchery, and one enterprising person was growing pigeons commercially. There was a good business in the sale of lots as the population pushed out from the urban areas of Anchorage, and good roads made summer homes more attractive in these outlying areas.

Educational facilities. There were eighty-two pupils in the Willow elementary school. High school students went to Wasilla, a round trip of over fifty miles daily for some of them.

Women's employment. Work opportunities were very limited. Most of the small businesses were family operated. There were a few openings in motel work and food service. Construction camps sometimes used women cooks during the summer.

TALKEETNA

Economy and geography. Railroading, road construction, charter plane service, tourist trade, mining exploration, and some sawmill work were the main businesses in Talkeetna, a village of about 150 adults on the Alaska Railroad 125 miles north of Anchorage. The trade area was made up principally of three or four hotels and motels, two stores and three bars serving homesteaders on both sides of the Susitna River and those scattered along the gravel road and railway from Willow.

Summer brought some overnight tourists from Anchorage and some Fairbanks people traveling by rail or plane stopped there. Hunters, fishers, and mountain climbers used the facilities of the community. Mining had ceased to be of great importance.

Educational facilities. There were twenty-five students in the high school and fifty-seven in the grade school, a part of the Matanuska-Susitna Borough School District. There were no adult education programs.

Health services. A part-time public health nurse was assigned to the community from Palmer. There were no hospital facilities and no doctor.

Women's employment. Ten or twelve women worked the year around. Much of the work was by owner-operators. Construction camps used food service workers during the building season. A need for an automatic laundry service was mentioned by several women.

CHAPTER X

KENAI PENINSULA AND KODIAK

Seward

Economy and geography. In 1965, Seward residents estimated the town's population to be 2,300. The 1960 census figures for Election District 11 were:

Seward	1,891
Cooper Landing	88
Hope	44
Moose Pass	136

Seward was a seaport at 60° 06' N., 149° 27' W., on Resurrection Bay off the Gulf of Alaska.

The people of this community were searching for ways to replace earthquake damage and to develop new industry. The town's port facilities had been wiped out with $1,000,000 damage to docks and warehouses.[1] The highway, bridges, and railroad between Seward and Anchorage had not been completely rehabilitated in 1965. Longshoring and fishing, the main businesses before the disaster, had given way to government work and construction which employed an estimated 700 in 1965. Many longshoremen and unskilled laborers were unemployed, or had part-time work which averaged $3,000 yearly. Most of the unemployed were in the thirty-five to fifty-five year range. Transportation was expected to regain its position as the largest source for

---

[1] Alaska Monthly Review of Business and Economic Conditions. May, 1964.

employment.[2] A Corps of Engineers project and Forest Service activities partially accounted for the large number of government workers.

The Employment Service was actively engaged in community affairs and was interested in the development of new industry. A citizens' committee was working with the City Council to find ways to increase business opportunities.

Educational facilities. There were a kindergarten, two elementary schools, and one high school. The latter had an enrollment of 186 in 1965. The enrollment in other area elementary schools was as follows: Hope, 9; Moose Pass, 59; Cooper Landing, 26. There were no local programs for training beyond high school and no vocational education in the secondary school. A few young people were taking Manpower Development and Training courses in Anchorage. A school officer indicated that 60 per cent of the seventeen girl graduates the previous year had continued schooling.

Health services. One of the two hospitals, owned by a church, could care for sixteen patients, specializing in the care of tuberculars. The other, a 30-bed general hospital, was owned by the city of Seward and provided employment for nineteen women. There was some desire expressed in the community to have it serve as a "half-way" house for convalescents.

Women's employment. Of the approximate one hundred regular jobs for women, many involved the use of domestic knowledge and skills. These were:

---

[2] Report of Local Study Group on Mental Health in Seward. January 11, 1964.

School lunch	3
Hospital, non-professional	10
Children's home	4
Private housekeepers	4
Hotels	10
Bakery	4
Restaurants	14
Cannery (seasonal)	50

There were openings for an experienced drug clerk and one or two beauty operators at the time the survey was made.

Several persons mentioned that almost any kind of job training would be beneficial for girls who do not go on to college.

There were an estimated ninety full-time and twenty part-time working mothers between Seward and Cooper Landing. One-third to one-half of the labor force was female in January, 1964. It is interesting to note that there were forty-eight private household workers in 1959. No doubt this was because many of the working mothers hired full-time child care.

Median Income:	$1,010

In 1959, there were 1,558 persons who worked. Seven hundred and eight of them worked less than forty weeks during the year.

KENAI

Economy and geography. This town was on the west shore of the Kenai Peninsula, on Cook Inlet, seventy air miles and some 160 miles by road south of Anchorage. Fishing and fish canning and service industries were the most important business activities. Kenai businessmen were searching for ways to improve the town's economy. Small Business Administration financing had been used for projects there and in Soldotna. A fish processing plant that could hire fifteen to twenty-five women and a business involving motel, cocktail lounge, and restaurant that could hire six or more were being planned. A $350,000 hospital and a $340,200, thirty-unit motel were approved by the agency for Soldotna, near Kenai.[1]

Educational facilities. An elementary school, a junior high school, a high school with an enrollment of 316, and evening courses from the University of Alaska provided education for area residents.

Health services. There was a clinic in town which did not have a doctor at the time the survey was made. A public health nurse covered the peninsula between Homer and Seward jurisdiction.

Employment for women. Most of the businesses were husband-wife operated. Women who had been trained elsewhere held most of the jobs requiring skill. The canneries, which hired local women, operated only during the salmon runs. The schools hired twenty-two teachers, five office workers, and five for food service. The bank used six women whom they trained; the laundromats, three; another nine to twelve worked in restaurants. Some

---

[1] Anchorage Daily Times, July 27, 1965.

of the latter were also owners. Three women worked for the city.

HOMER

Economy and geography. The 1,247 people that made up the Homer trade area lived along the Kachemak Bay at 59° 39' N., 151° 33' W., on Cook Inlet on the southeastern side of the Kenai Peninsula. The open, grassy countryside and the relatively high temperatures made commercial livestock growing possible. A long spit made a quiet harbor which was used by numerous fishing boats. Docks and other harbor facilities were being replaced after earthquake damage. Fishing and tourist trade were the main businesses. A ferry from Kodiak stopped there twice a week. The town was available by highway from Anchorage, and there was frequent air service. Residents were looking for ways to increase tourist trade. Some said that an improved ferry schedule allowing more time for stop-overs would help.

Educational facilities. The Kenai Peninsula Borough School District high school in Homer had 141 students, the grade school, eighty-four. The Extension Service of the University of Alaska offered adult classes through the home demonstration agent's office in Homer. The agent had covered the peninsula from Seward to Afognak Island and Old Harbor during the summer of 1964 teaching classes in low-cost meal planning, repairing and salvaging of furniture, and planning for repair and replacement of homes.

Five of the eight girls who were graduated from Homer High School in 1964 continued their training---three in business school and two in college. One class in home economics was being taught in the high school. It was not a popular subject with the parents, a school administrator said.

Health services. Homer had a doctor and a public health nurse. A health clinic was open for scheduled public services.

Employment for women. Most of the employment for women was found in schools, canneries, State offices, the Homer Electrical Association, banks,

and small businesses with a husband and wife operation. There appeared to be enough women to fill all available jobs. Some women earned money picking berries for a well-established business which processed local products. Others knitted sweaters for sale; the local magistrate was a woman. The local schools hired thirteen teachers, one and one-half secretaries, and three school lunch workers. Their ages were from twenty-three to fifty-five.

Some restaurant owners expressed a wish that there were more trained food service workers. Cabin crafts were popular with many women, but the market for their products was limited and sales slow. A person who had worked in this area for four years said that there were some real pockets of poverty in some of the village areas and it would be very worthwhile for the women to be able to supplement the family income.

Some of the married women in Homer had been trained for skilled work that was not available there. For example, a woman who had worked for ten years as an instructor in data processing and other business machine techniques was unable to use her training in Homer because of the small size of the businesses.

A forty-four year old woman had come down from the Arctic years before, married, raised a family, and found steady work in a cannery. She said that she would like to have become a nurse. Her lack of formal education limited her to unskilled jobs. Many of the married women in the area were formerly nurses, so that there were many more available than there were openings.

KODIAK

Economy and geography. Kodiak was a well-established fishing town on the eastern side of Kodiak Island in the Gulf of Alaska at 57° 47' N., 152° 24' W., with an adjoining Naval Base which served as Alaskan headquarters for the United States Navy. Fishing had been the main business in Kodiak since long before the purchase of Alaska by the United States. The principal seafood had been salmon until the development of crab processing plants. There were three kinds of crab of economic importance: king, dungeness, and tanner. Scallops, halibut, shrimp, and herring were available in commercial quantities.

At the time of the survey, Kodiak was busy with reconstruction after the seismic wave of March 27, 1964. Agents from the Small Business Administration, Urban Renewal, and the Bureau of Fisheries were assisting in planning. Night clubs, restaurants, and a shopping center were scheduled for the city.

Educational facilities. Church and public elementary schools, a 340-student high school serving town and Navy Base children, University of Alaska extension courses offered on base but open to Kodiak residents, and evening courses at the high school provided education for the people of Kodiak. Office training was popular in the extension and evening classes.

Of the twenty-eight girls who were graduated from high school in 1963, nineteen went on for further training. An agent with Public Health and Welfare estimated that about one-fourth of the girls from villages near Kodiak went to school beyond the eighth grade, and of that number about one-third finished.

Health services. Medical facilities for the island consisted of an eighteen-bed hospital administered by Catholic sisters, and a public health center with a full-time nurse. Physically handicapped women and girls on public health records were: two crippled from accidents on a job, one mentally retarded, one mentally affected, one cardiac patient, one with defective vision, and four congenital heart cases.

Women's employment. Forty to forty-five women on the island received Aid to Dependent Children. In the town there were nine, with one receiving Old Age Assistance, and three on general relief. None of the mothers receiving ADC had an education beyond the ninth grade and several had less. Five of the nine had had from one to five children outside of marriage. One mother of five had never been married. Poor money management and drinking were problems. Many had a strong sense of motherhood and were reluctant to go to work until their children were several years old, according to a social worker.

The largest employers of women were the canneries. Many operated all year long, providing regular employment in processing for nearly 75 women. Other women were hired for marketing the seafood.

Motels, hotels, restaurants, and canneries provided work opportunities for the under-educated women. An observation of local restaurants showed that there was an obvious need for upgrading the standards of those in food service. State and Federal agencies, service industries, small businesses, the hospital, and schools provided most of the employment for women who were not cannery workers. There were two jobs open for office managers. The practice of hiring the wives of military personnel for State and private businesses indicated that there were not enough trained local

women to fill job requirements. A ruling in effect on the base prohibited the hiring of domestic helpers, although wives of Navy and Coast Guard personnel held some of the more important administrative jobs off base.

In mid-September, 1964, the Employment Service office had openings for one skilled and thirteen unskilled females. Since the salaries in the fish processing plants were higher than the going rate for waitresses, many preferred the former work.

The Kodiak school system, including the outlying elementary schools, hired forty-five women teachers, one nurse, two clerks, and three and one-half cafeteria workers. One female employee had a vision handicap.

CHAPTER XI

SOUTHEASTERN ALASKA

An understanding of the economy and sociology of the Tlingit Indians was pertinent to a study of Southeastern Alaska. Indian villages were scattered from Ketchikan to Katalla. Each village was part of the complicated social structure characteristic of the Tlingits. Before the invasion of outsiders they had reached a high level of culture, second to the Aztecs and Incas, though agriculture was not a part of their lives. Their crafts included the making of wooden bowls and other carvings of bone, horn, or wood as well as ornamented baskets made of spruce root and grass fibers.[1]

The current status of Indian crafts was recently reviewed in a report to the Bureau of Indian Affairs, which pointed out the factors that should be considered in developing native arts for commercial purposes.[2] Fishing was the basic source of livelihood in Tlingit villages, and the economy of the people was primarily dependent upon the yearly runs of salmon.

[2] Alaska Native Arts and Crafts, Potential for Expansion. Final Report to the Bureau of Indian Affairs, University of Alaska, July, 1964, pp. 65-69.

KETCHIKAN

Economy and geography. Ketchikan, with 6,483 people in 1960, was the fourth largest and southernmost city in Alaska. The Alaska Business and Economic Review, January, 1965, gave the population within the city limits as 6,900 and in the trade area as 10,500.[1] Ketchikan was on the southwest side of Revillagigedo Island, above the Tongass Narrows, at 131° 39' W., 55° 21' N., with Canada less than a hundred miles away and Seattle some seven hundred miles to the southeast. Temperatures were relatively mild, the yearly average being 46.2°. Rainfall at the rate of 151.93 inches a year made the area one of the wettest in the United States.

The salmon industry in Seattle had long used Ketchikan as an important base of operations and fishing was for many years the most important reason for the town's existence. As a result, the town identified in many ways more closely with Washington State than with northern and western Alaska.

Since 1954, the pulp industry had surpassed fishing as the basis for Ketchikan's economy. In 1964, the Ketchikan Pulp Company's mill operated continuously and directly employed approximately 500 persons. In addition, about 200 men were engaged in the company logging operations and some 400 other loggers were employed by companies supplying the mill.[2]

The Ketchikan labor market included the city of Ketchikan, the residential communities of Mountain Point, Herring Cove, Saxman, Survey Point, Ward Cove, Carlanna, Shoreline Drive, Refuge Cove, Mud Bay, Port Higgins,

---

[1] Alaska Monthly Review of Business and Economic Conditions. January, 1965. p. 7.

[2] Ibid., September, 1964. p. 3.

Metlakatla, Annette, and the interconnecting highways.[3]

In September, 1964, there were 5,010 employed persons in the Ketchikan area. There was an unemployment rate of 2.5 per cent at that time. Employment classifications were as follows:[4]

Classification	Number of Persons
Mining	0
Contract Construction	350
Manufacturing	1,400
Transportation, Communication, and Public Utilities	700
Trade	590
Finance, Insurance, and Real Estate	100
Service and Miscellaneous	410
Government	810
Other	650
Total Employment	5,010

Educational facilities. The Ketchikan High School had an enrollment in 1964-1965 of 598; the junior high, 188. There were 2,594 students enrolled in Gateway Borough School District schools. The previous year, twenty girls, about half of those graduating, went on for further schooling. Metlakatla, a part of the Ketchikan trade area, had 106 students enrolled in high school. The only woman on the staff was the vocational home economics teacher.

---

[3]Ibid., September, 1964. p. 7.

[4]Ibid., January, 1965. p. 7.

A community college was established in 1954 to offer collegiate courses for academic credit. The courses were offered in the late afternoon and evening, and the courses and instructors were approved and supervised by the University of Alaska. In addition, the college offered vocational and interest courses under the sponsorship of the local school district.

Manpower Development Training courses were taught as requested. Recently there had been a steward-waitress course to train workers for the ferry and another in longshoring. The high school offered vocational courses at the undergraduate level. A retail sales class with work experience was part of the curriculum for 1964-1965. Vocational homemaking was taught in the high school. A counselor expressed the opinion that more job training in the high school with related experience in industry would help curb the dropout problem among fifteen- to sixteen-year old girls.

Health services. The health center of the Department of Health and Welfare employed a full-time public health nurse; and an itinerant nurse covered Annette, Cape Pole, Marguerite Bay, Metlakatla, Red Bay, Thorne Bay, 12 Mile Arm, Craig, Hydaburg, and Klawock.[5]

There was a full-time nurse at the Ketchikan High School. A sixty-five-bed hospital was owned by a church and administered by a board of townspeople.

Welfare. Women receiving welfare aid in the Ketchikan district, covering the area south of Frederick Sound, were as follows:

---

[5]Nursing Personnel List, Department of Health and Welfare, Division of Public Health, January, 1965.

Aid to Families with Dependent Children	83
Old-Age Assistance	55
Aid to Disabled	13
Aid to Blind	2
General Relief	2

Women's employment. Businesses in Ketchikan affecting women's employment related to domestic knowledge and skills as listed in the telephone directory were:

Beauty Parlors	6
Restaurants	19
Hotels	6
Grocery Stores	12
Canneries	6
Laundries	3
Cleaners	5
Department Stores	2

A thirty-unit motel with cocktail lounge and dining room was scheduled for completion in 1966.

The hospital employed women for these jobs:

Food Service Workers	14	Licensed Practical Nurses	7
Housekeepers	8	Laboratory Technicians	1
Aides	10	X-Ray Technicians	1
Seamstress	1	Physiotherapist	1
Laundry Workers	4	Clerks	9
Registered Nurses	13	Total	69

An employment service agent stated that supply and demand for women employees was about balanced. Employers interviewed suggested the following were always in demand: clerk-steno, office machine operators, bookkeepers, baby sitters, part-time housekeepers, licensed practical nurses, trained waitresses, skilled cannery workers, and retail clerks. Several employers said that although these jobs were filled, it was often by untrained women. An employer indicated that most women employees had worked at their jobs less than four years.

There had been no public day care center for children of working mothers. Some private homes took in several children at a time. The main need for child care was during the fishing season. Centers to care for children (ages six to twelve) of working mothers were started as part of a Community Action Program by the Salvation Army in Saxman, Metlakatla, and Klawock during the summer of 1965. Each center was to hire two teachers, three student aides, one cook, and one custodian.[6] The program was offered for seven weeks during the canning season. Some younger children were enrolled in Operation Headstart in these communities.

PETERSBURG

Economy and geography. Petersburg, population 1,600, on Kupreanof and Mitkof Islands, at 56° 49' N., 132° 57' W., was considered for many years to be one of the most economically stable communities in Alaska. This reputation was partially earned because of the size of bank deposits in relation to the number of inhabitants. The Norwegians who had settled there had carried with them their habits of frugality as well as resistance to change, noticeable in the buildings and businesses of the town.

The Alaska Marine Highway traffic did not have the positive effect on the economy of the town that some people had expected. There were several vacant business buildings along the main street. Restaurants serving downtown customers in February, 1965, did not make use of some of the modern methods used by similar establishments in other Alaskan towns of the same size.

Government assistance was criticized by many, yet the rate of insured employed was nearly the highest in the State. A State legislator had recently forwarded a resolution to the United States Department of Agriculture asking that Federal support for the Petersburg Experimental Fur Farm be continued for at least one year while State personnel studied the problem. Another resolution was to go to the University of Alaska Board of Regents asking that they investigate the problem and, if necessary, plan for a complete State-supported operation, even if it were on a reduced scale.[7]

---

[7] The New Petersburg Press. Petersburg, Alaska, February 5, 1965.

Petersburg had been built upon the fishing industry, with facilities for processing halibut, salmon, shrimp, crabs, and clams. In 1965, local businessmen formed a corporation to buy a large cannery. It was to be operated in connection with gill net fishing and king crab processing. The use of the mess hall and bunk houses was to be discontinued.[8] Some logging was done in the Petersburg area for the Wrangell mill. There were a new, modern motel and a hotel in the main part of town that were open the year around. To be started in 1965 were twelve low-income and twenty-four medium-income housing units.[9]

Educational facilities. The incorporated school district had an elementary school and a high school with 132 students. Vocational home-making was taught in the secondary school. A bond issue of $65,000 was proposed to build a technical arts building for a high school so that a comprehensive vocational education program could be initiated for those students not planning to go to college.[10]

A University of Alaska extension course in mining was offered at the time of the survey. Occasionally short courses for women were given by an Agricultural Extension agent.

Health services. A twenty-one-bed hospital served the community. A public health nurse, who also served Wrangell, was stationed in Petersburg.

---

[8] The New Petersburg Press, op. cit.

[9] Figures furnished by Alaska State Housing Authority by telephone, July 22, 1965.

[10] The New Petersburg Press, op. cit.

Women's employment. Businesses hiring women in fields interesting to this study were:

Cleaner	1
Laundry	1
General Stores	8
Grocery Stores	2
Hotels	2
Restaurants	4

The hospital hired women, whose ages ranged from twenty to sixty, as follows:

Registered Nurse	5
Aide	1
Housekeeper	1
Secretary	1
Cook	1½

An employment service agent stated that there was a good balance between supply and demand for women employees. Canneries provided much of the work, but there was virtually no activity between February and May first in this industry.

There had been no organized child care for children of working mothers although several people said that it would be a very good thing during the canning season. The Salvation Army, working with the Community Action Program, was to conduct one for six- to twelve-year olds during the summer of 1965 for seven weeks.

WRANGELL

Economy and geography. Wrangell, the second oldest settlement in southeastern Alaska, was on the northern tip of Wrangell Island at 56° 28' N., 132° 23' W., twenty miles from the Canadian border. The processing of seafood had been the main business for many years. The fishing industry supported canneries for shrimp, crab, and salmon. The largest catches were of halibut and salmon which sometimes exceeded 2,000,000 pounds annually.

The output of a Japanese-owned lumber mill comprised over 50 per cent of Alaska's yearly lumber production. It exported about 67.7 million board feet in 1963.[11] Non-saw logs were towed to the Ketchikan and Sitka pulp mills.

A Wrangell businessman stated that it was difficult to get mill employees up from the lower states because of limited housing. Construction of a twenty-four-unit housing project to be rented to families with yearly incomes of $13,500 or less and of a twenty-unit project for low-income families was to be started in 1965.[12]

Educational facilities. An incorporated school district included an elementary school and a 121-student high school that offered vocational home economics. Extension courses in school finance and art under the sponsorship of the University of Alaska had recently been taught. Occasionally, adult classes were led by an Agricultural Extension agent.

---

[11] Alaska Monthly Review of Business and Economic Conditions. September, 1964. p. 4.

[12] Figures furnished by Alaska State Housing Authority by telephone, July 22, 1965.

Five of the fifteen girls graduated in 1964 had gone on for further schooling.

Health services. A community hospital with fourteen beds was housed in what had formerly been an Episcopalian mission facility. A public health nurse stationed at Petersburg was assigned to Wrangell.

Women's employment. Women's work was seasonal and largely dependent upon fishing and provided jobs for 108 females during the peak of the canning season. The number of women over sixteen years of age was estimated by one of the town leaders to be 375 to 400. Employment for women was low during the winter, the main jobs being those with professional training requirements such as teaching and nursing. Businesses were small and many were family owned and managed. There were thirteen women teachers and two female secretaries working for the school district.

The community hospital hired women for the following jobs:

Registered Nurse	3
Practical Nurse	1
Cook	1
Laundry Worker	1
Cleaning Woman	1

SITKA

Economy and geography. Sitka was founded as a Russian village in 1799 near an Indian site on the seaward side of Baranof Island, 57° 03' N., 135° 20' W. It was 1,000 miles from Seattle, 95 miles south of Juneau, and 195 miles northwest of Ketchikan. The population, including that of the government installation, some 500 feet across the channel at Mt. Edgecumbe, numbered 7,000.

The main roads were those connecting the canneries, pulp mills, and airport with the town. Amphibious planes operated by two Alaskan companies served the community. An airstrip was being built. Two steamship lines provided freight service and the Alaska Marine Highway ferry stopped regularly.

The mild climate, with an average annual mean temperature of forty-four degrees, made year-around outdoor work possible. A sixty-six million dollar pulp mill established in 1960 provided employment that exceeded fishing as a source of individual income. The mill, located near town, employed 500 people in 1964 with several hundred engaged in logging operations in the area.[13] The 150,000 tons of pulp produced each year were used in the Japanese rayon industry.

The permanent civilian population at Mt. Edgecumbe was 1,966 in 1960 made up principally of medical and educational professional staff and their families.[14] In 1959, there were 2,793 "non-white" persons living in the

---

[13] City of Sitka, Alaska, 1961. Annual Report.

[14] Ibid.

Sitka area. This was almost half of the total population. Residency was fairly stable according to Alaskan standards. Only 1,454 of the 5,825 people five years old and over had lived in a different state five years previously. Since that time, employers at the pulp mill had brought in many workers from other states so the proportion of long-time Alaskan residents had no doubt become smaller since the time of the 1960 census.

Educational facilities. Sitka had been the center for native education in Alaska since the Russians established a school there for Indian children. The Department of Interior operated a boarding school, grades nine through twelve, for students who were at least one-quarter Native. During the school year 1960-1961, 672 children attended. In 1965, there were not enough openings for all of the students who wanted to attend. Preference was given to students from towns and villages in the State that did not have high schools. In 1965, 305 girls were attending and were required to take home economics. In these courses, many girls from remote villages learned to use and care for modern equipment for the first time.

There was a high school, a junior high school, and two elementary schools within the Sitka incorporated district and an elementary school at Mt. Edgecumbe. Vocational home economics was offered in a modern homemaking department in the Sitka High School. Adult education courses were sometimes offered by the Manpower Drvelopment and Training Act, Bureau of Indian Affairs, or extension.

Sheldon Jackson High School and Junior College, a Presbyterian mission, enrolled students from many parts of the State, the majority of whom were Native. Home economics was offered in the high school and the Junior College had classes in foods, clothing construction, the family, general

nutrition, and food service. The food service course was popular with male students. The function of the college, according to its catalog, was "to serve students who desire one or two years of training beyond high school, those who desire the first two years of university parallel courses, and adults who wish to continue their education either with or without college credit".[15]

Health services. The United States Public Health Service maintained a 250-bed tuberculosis hospital for Alaskan natives at Mt. Edgecumbe. A community hospital with twenty-three beds served the town's residents.

Women's employment. Interviews with educators and social workers indicated that there was some need for domestic help, skilled food service workers at Mt. Edgecumbe and the Pioneer Home, hospital aides at the latter, homemaker service, and organized child care. The number of employed females in 1965 was estimated at seven hundred.

In addition to the public agencies that provided women's employment opportunities related to home economics such as the hospitals, boarding school, and Pioneer Home, there were the following businesses:

Beauty Salons	4	Hotels	3
Cleaner and Laundry	1	Janitor Service	1
Laundromat	1	Restaurants	10
Drugstores	1	Sewing Centers	2
Florist Shop	1	Women's Apparel Stores	4
Retail Grocers, Including Two Cold Storages	10		

[15] Sheldon Jackson High School and Junior College Catalog, 1964-1965. Sitka, Alaska.

Many of these were "husband-wife" enterprises that used help seasonally or not at all. Female income was not high as indicated by charts following this section. A large number of women were in service work, private households, or retail selling. The higher-paying women's jobs were those requiring professional or technical training in medical and health services. Of 982 female residents in 1959, there were 195 employed in professional, technical, and kindred occupations; 89 in medical and health services; and 57 in education. It would seem reasonable that the native girls attending the Mt. Edgecumbe boarding school should be encouraged to train for these jobs.

JUNEAU-DOUGLAS

Economy and geography. The capital of Alaska, population 6,797, was on the mainland of the southeastern part of the State about 900 miles northwest of Seattle on the Gastineau Channel at 58° 18' N., 134° 25' W. Three miles away, across the Gastineau Channel by bridge, was the city of Douglas with 1,042 inhabitants. A Chamber of Commerce estimate placed the area population at 13,000 in May, 1965. This included areas along the North Douglas and Glacier Highways, Mendenhall Valley, and Auke Bay. Annual mean temperature was 42°; the July mean, 56°; and January, 29.5°. There was an annual rainfall of eighty-five inches and annual snowfall of one hundred inches. The rain and relatively mild temperatures usually prevented a heavy accumulation of snow.

The economy was primarily dependent upon governmental activities, fishing, forestry, tourists, transportation, trade, and mining. Four airlines served the area, and a steamship company maintained year-around freight service. Two Canadian and one American steamship offered summer passenger service.

Employment within the Juneau labor market was 5,840 in May, 1965. The unemployment rate was 3.6 per cent at that time. Job openings at that time were for civil engineer, social welfare worker, stenographer, typist, and baby sitter.[16] A Youth Opportunity Campaign was expected to affect summer employment. A Neighborhood Youth Corps supplied work for clerical aides, nurses' aides, Operation Headstart, and recreation workers.

---

[16] Labor Market Newsletter, "Characteristics of the Insured Unemployed", Table IV. Employment Security Division, Alaska Department of Labor, Alaska State Employment Service, Juneau. Volume V, Number 5, May, 1965.

Employment for May, 1965, was:[17]

Mining	10
Contract Construction	280
Manufacturing	160
Transportation, Communication, and Public Utilities	490
Trade	560
Finance, Insurance, and Real Estate	130
Service and Miscellaneous	500
Government	3,090

Seasonality was typical for some occupations. The number of insured jobless persons was down 35 per cent in May from the previous month due mainly to contract construction and manufacturing activity.

Educational facilities. There were 874 students in the high school, 230 in the junior high school, and 2,060 in elementary schools in the Greater Juneau Borough School District in 1964-1965. Community college courses were held at night in cooperation with the University of Alaska. Daytime freshman college courses were planned for the following year. There were two parochial schools, one Seventh Day Adventist and the other Roman Catholic.

Health services. An eighty-bed hospital was run by the Roman Catholic Church. A United States Public Health Center was in operation with two full-time nurses.

Women's employment. Since 3,090 of the 5,840 persons employed in May of 1965 were in government, it was obvious that opportunities for

---

[17] Ibid.

women would be mainly in the clerical field. Employers' requests during the month of June were as follows:

Type of Work	Placements	Unfilled
Domestic and Cleaning	10	1
Child Care	5	9
Service	20	2
Draftsmen	--	1
Clerical	25	16
Professional	6	1
Retail Sales	2	--

There were four private day nurseries for children.

HAINES

Economy and geography. A cluster of small business and government buildings, family residences, and an Army post that had been adapted to civilian use made up the area known as Haines-Port Chilkoot with a population of 512 at 59° 14' N., 135° 26' W., on the northern end of Lynn Canal about eighty miles north of Juneau and twenty miles southwest of Skagway. At one time it had been an Indian village, later a mission, then an Army fort, and finally an important link for road and ferry travel between the Interior, southeastern Alaska, and states to the south.

The climate was typical of southeastern Alaska with high average annual rainfall. This weather encouraged the growth of forests, most of which had been untouched, although a few sawmills were in operation. Mineral deposits had been discovered but were virtually undeveloped.

Tourist trade, fishing, lumbering, and light manufacturing of arts and crafts were the main businesses. An Area Redevelopment Administration technical assistance project for developing enterprises to mass produce Alaskan craft items was approved in 1965. Forty workers, mostly Indians, were being trained under the Manpower Training and Development Act. Women were studying art, lapidary work, and textile design. The buildings of the former Army post were used for those projects as well as for tourist facilities. An interest had been developed for the preservation of Indian folk customs as well as native crafts and this area had become somewhat famous for activities of that nature.

Agriculture on a small scale had been practiced since the time of the first Outside settlers. The area had become particularly well known for its strawberries and some small businesses had been based upon the sale

of plants and berry products.

Educational facilities. There were an elementary school and a seventy-seven-student high school with vocational homemaking. Manpower Development and Training was offered, as mentioned earlier. Some of the students involved in that program came from other parts of Alaska. Some of those from the local area had been dropouts. Several were girls who had married early and had families. Some physically disabled were being trained.

Seven of the ten girls graduating from high school the previous year were continuing their studies.

Health services. There were a doctor, a dentist, and an X-ray technician as well as an itinerant public health nurse. The short flight to Juneau made it possible for people in this area to make use of hospital service there.

Women's employment. Besides the eight women school teachers, there were around twenty others regularly employed. This number included: three grocery clerks, three dry goods clerks, two bookkeepers, three secretaries, three bank employees, one hotel maid, an X-ray technician, and a part-time nurse. Other women workers were helping with family-owned businesses. The number of women involved in food service varied with the seasons and tourist travel.

A day care center was planned as part of a Community Action Program for the summer of 1965 for twenty-five to thirty-five children under eight years of age.

HOONAH

Economy and geography. This Tlingit Indian village on the northeast coast of Chichagof Island in southeastern Alaska had a population of 686 in 1960 and nearly 800 in 1965. The estimated 125 families in the town lived along three streets at the foot of heavily wooded mountains. A mild climate and ice-free waters made year-around seine fishing possible. During a good season, fishermen could expect to make several thousand dollars. Fish processing provided work for many men and women. Some residents went to Excursion Inlet, twenty miles south, for the summer fishing season. Others found employment in Juneau or Sitka. The standard of living was considered high for a small fishing community. Sturdy frame houses with modern furnishings, many with indoor plumbing, reflected the prosperity enjoyed during good fishing years. A White Alice site added about twenty-five non-Indian people to the community. Other than these, most of the Hoonah residents were natives. Members of an active chapter of the Alaska Native Brotherhood made frequent use of a large community hall.

Wharves with docking facilities, an oil and fuel business, three general stores, a small hotel, a coffeehouse, a luggage store, and two movie houses made up the business community. Daily plane service to Juneau and fishing villages enroute was scheduled the year around. A large amount of travel between villages was by boat.

Subsistence activities still played an important part in the economy. Birds, deer, and other animals as well as fish were stored for winter use. Most of the opportunities for paid employment were available in the summer.

There was no welfare agent in Hoonah since cases were handled out of Juneau. Ray stated that welfare payments were low during the summer months

and mounted steadily until early spring, and that in 1961 a State work relief project for depressed communities was initiated in Hoonah. At that time, sixty-three families received some sort of financial relief from the Bureau of Indian Affairs.[18]

Ray also pointed out that there was more reliance on cash for purchasing food, clothing, furniture, and luxury items than in Eskimo villages included in his study. He said, furthermore, that "It . . . appears that expenditures for alcoholic beverages are high in Hoonah and that they constitute a considerable drain on the existing limited income."[19] It will be recalled that similar remarks by residents of the Arctic villages were quoted earlier in this report.

Educational facilities. The Hoonah School District had one elementary school and a high school with 190 students. The latter had been operating for two years. Prior to that time, most of the students had gone to Mt. Edgecumbe High School after completion of the eighth grade, or to Sheldon Jackson, a parochial school in Sitka. A vocational homemaking teacher was hired for 1965-1966. The high school had been well received by the community. School basketball games were a popular social event and helped dispel the tedium of village life.

The District had offered courses for adults in Spanish, leather work, and typing the preceding year and a Manpower Training course in fishing. Two of the three girls graduated from the high school had gone on for

[19]Ibid.

further study---one to beauty school and the other for secretarial training. The third had married.

Women's employment. Opportunities for women's work were found to be greatest from April to November. Crab and salmon catches were processed during those months providing employment for about fifty women. A woman could expect to earn at least a thousand dollars for a summer's work during a good year.

The small businesses were family owned hiring little help. Winter jobs were available for about eleven women. Around twenty women sewed craft products for the Bureau of Indian Affairs.

A day care center for children of working mothers administered by the Hoonah Public Schools in cooperation with the State Division of Public Welfare and other agencies was offered for the second year. Seventeen women, some part-time employees, had worked with the demonstration day care center in 1964. The popularity of the center seemed to be based as much on the fact that it provided employment for women as on the care it gave to the children. Women of the community were very anxious to see it offered every summer.

CORDOVA

Economy and geography. According to the 1960 census, the Cordova-McCarthy Election District included the following populated areas:

Boswell Bay	32
Cordova	1,128
Meakerville	48
Point Whitshed	28
Yakataga	48

Cordova was on the eastern side of Prince William Sound at 60° 33' N., 145° 46' W. Fishing and fish processing were the main businesses of the community. Road building and the construction of a small boat harbor provided employment in 1965. Many of the businesses in town were service or trade establishments and were family operated.

At the time of the 1960 census reporting, 905 of the 1,759 residents had recently moved into their houses. A fourteen-unit, low-rent and a twenty-four-unit, medium-income housing project were to be built.[20]

Both north and southbound planes stopped daily. During the summer, there was a weekly ferry from Seward. Another Alaska Marine Highway ship made two round trips each week between Valdez and Cordova. Privately owned steamships provided regular freight service.

Educational facilities. A kindergarten, an elementary school, and a high school with 106 students were administered within an incorporated school district. There was no hot lunch program. One year of non-vocational home economics was offered. According to the superintendent, adult

[20]Figures furnished by Alaska State Housing Authority by telephone July 22, 1965.

501 bb

education was offered as demanded. Recently, a Manpower Development and Training class in diesel engines had been taught.

Of the eleven girls graduated in 1964, four had entered college, two were taking a nursing course, and another was attending beauty school.

Health services. There was a twenty-two bed, church-owned hospital. Many of the patients were elderly men receiving Old Age Assistance. Food service was provided under contract with meals being prepared in another place and brought in.

Women's employment. The number of women working in canneries during the height of the season was estimated to be two hundred. The season was from May until September. During the winter, canneries could be expected to hire twelve to twenty women. There were around twenty women who fished commercially, usually on a family-owned boat.

The hospital hired the following women:

Administrator	1
Nurse's Aide	1
Dishwasher	1
Registered Nurses	4
Technician	1
Secretary	1
Laundress	1

Most of the employees had worked there less than four years.

Eleven women teachers and two female secretaries were working for the school district in 1965.

Hotel and restaurant trade was highly seasonal. The number of women working in these service industries in 1959 are given in the tables at

the end of this section. The telephone directory listed four hotels, one motel, three grocery stores, four restaurants, two beauty parlors, one bakery, one laundry and cleaner, and one washeteria.

OCCUPATIONS OF EMPLOYED FEMALES

CORDOVA

Female, Employed	130
Professional, Technical, and Kindred	32

CONCLUSIONS

After this study was started, the Economic Opportunity Act had begun to function effectively in many communities with the following programs helping to combat poverty in Alaska: Youth Corps, Project Headstart, Work-Study for College Students, Work Experience for Welfare Recipients, VISTA, Day Care Centers, Farmers' Home Administration Loans, and Technical Assistance in Community Action Programs. However, there was still much to be done toward providing more and better employment for women so that the standard of living in many families could approach the norm that has become accepted in America as decent living.

In summary, the study showed that:

(1) There are enough opportunities for women's employment in the domestic-related field to justify training programs.

(2) Women in Alaska cannot be expected to make enough money at native craftwork to contribute substantially to the family's economic welfare.

(3) Many women seeking work in Alaska are unskilled.

(4) Many Alaskan families are living in substandard housing because of inadequate income to pay for available higher quality living quarters.

(5) Job opportunities in the larger Alaskan towns are plentiful for trained women but are scarce for the untrained.

(6) Domestic work has such low social status that many women prefer to work for less money at other low-skill jobs.

(7) The status of domestic employment should improve if employers were more aware of the necessity for a professional relationship with employees.

(8) Emotional instability and the misuse of alcohol are factors that limit the ability of many women to hold jobs.

(9) A wife's choice of work is still often dependent upon her husband's approval.

(10) Most native women in the work force are in lower-paying, unskilled jobs.

(11) Food and hotel service throughout Alaska would improve with more trained workers.

(12) The physically handicapped are benefiting from vocational rehabilitation training programs.

(13) There is a large turnover among Alaskan working women.

(14) There are few job-oriented courses in home economics for high school students or adults in Alaska.

(15) Home economics courses of any kind are absent from many communities in Alaska where the standard of living indicates that individuals could well benefit from this type of training.

(16) Federal and State agencies can help provide more employment opportunities for women, as well as a community service, by setting up more day care centers and hot lunch programs.

RECOMMENDATIONS

In conclusion, the following recommendations are made:

(1) The effort to prevent high school dropouts should be increased.

(2) High schools should offer intensive courses in home economics for wage earning in schools where the dropout rate is high.

(3) Training programs should be based upon a study of community needs and consultations with prospective employers.

(4) Vocational education staffs should work closely with social welfare personnel to plan programs that will help decrease the number of recipients of welfare payments.

(5) Vocational education for women should include courses in money management and the use of credit.

(6) The number of public-supported day care centers should be increased.

(7) Employers of women in low-skill jobs should pay adequate wages while upgrading job standards to provide an incentive for better work.

(8) More job counseling should be done for students and adult job seekers.

Job Cluster Curriculum, A Blueprint for Technical-Vocational Education in Lane County, Oregon.

Lane County Intermed Dist Board of Educ, Eugene, Oreg.

65

DOCUMENT NOT AVAILABLE FROM EDRS 67p.

*PROGRAM EVALUATION, *VOCATIONAL SCHOOLS, OCCUPATIONAL SURVEYS, *SCHOOL SURVEYS, OCCUPATIONAL CLUSTERS, SECONDARY SCHOOLS, *CURRICULUM DEVELOPMENT, LABOR FORCE,

Lane County, Oregon,

A broad, multifaceted study was conducted in Lane County (1) to provide the knowledge necessary to improve the present technical-vocational offerings, (2) to develop plans that would coordinate the high school programs with the community college, (3) to provide the school districts with a blueprint for establishing local technical-vocational facilities and curricula, and (4) to consider the feasibility of an area technical-vocational high school. Data from the Oregon Employment Department, the Lane County Youth Survey, the Lane County Board of Education, and other sources were examined. From this came 11 recommendations, including -- (1) Improve articulation and assignment of responsibility, (2) Secure more qualified technical-vocational teachers, (3) Hire a regional technical-vocational consultant, (4) Initiate cooperative work experience programs, (5) Develop technical-vocational libraries, (6) Coordinate the apprenticeship program with school and college curricula, and (7) Define a policy for publicly supported occupational education. Tables covering student aspirations, employment needs, enrollment data, program offerings, financial data, school statistics, etc. are given. (EM)

FOREWORD

This study originated with the superintendents of seventeen school districts in Lane County, Oregon.

It was coordinated under the direction of the office of the Lane County School Superintendent.

Local school districts have long felt the need for more highly-developed and adequate vocational-technical education. But many perplexing problems have retarded the growth of this phase of education. Obsolescence, automation, regional manpower needs, financing, relationship of secondary schools to higher education, lack of curricular articulation and continuity have all contributed to the dilemma of providing a comprehensive program.

The passage of the 1963 Vocational Education Act made federal funds available so that a region could study its vocational-technical educational needs. With this opportunity the Lane County School Superintendents urged the Lane County Board of Education to apply for research funds to conduct an area-wide study.

A proposal was submitted to the Oregon Department of Education, and funds were granted for such a study.

The study began March, 1965, directed by a committee which brought many varied backgrounds and disciplines to bear on the project: Charles Smith, Ad. Asst. to the Superintendent for School District No. 19, Springfield, was the assistant project director; George Ruby, Vocational Coorddinator for School District No. 4, Eugene; G. R. Bloomquist, Assistant Dean of Instruction of Lane Community College; and Bruce McKinlay, Labor Analyst with the Oregon State Employment Service, were other members of the working committee.

This group met regularly as a committee to discuss the entire project, individual projects, and various recommendations. There was a large degree of coordination throughout.

The report was improved in large measure by the editing work of Dan Sellard, Eugene news report, illustrations by Jim Brick, and proof reading by Laura Johnson.

Many thanks are due district superintendents, high school principals, personnel of the State Department of Education, representatives of labor, business and industry in Lane County, and members of the Lane County Board of Education.

The report is not intended to be the last word on vocational-technical education in Lane County, but rather is intended to serve as a guide, beginning to point the direction, and to serve as a basis upon which individual school districts can build for the future.

The public schools of Lane County have a new challenge, as well as a new opportunity, in the opening of an area-wide Lane Community College. Students who do not go from high school to a four-year college can attend Lane Community College and become prepared for specific occupations.

Vocational-technical education can broaden perspectives and prepare a person for new opportunities and further growth. Today, there is an open door to the future for the person who has the advantages of a sound, well-coordinated vocational-technical education program. It is, we sincerely believe, up to the public schools to keep open this gateway to opportunity and we can do no less than assure the citizens of Lane County a program which offers great opportunity to ALL our citizens.

DALE PARNELL
Project Director
President, Lane Community College

CHAPTER I — INTRODUCTION

By the very nature of its organization, education in America today is constantly faced with a dilemma: How can it know what best to do, how can it maintain a core of consistency yet be flexible to changing times, and once it has an answer, how can it then gain support from the community whose children it serves?

At the very heart of a democracy, in the very soul of a modern nation, is the educational system. The system simply must serve the nation, it must provide the community with its skilled artisans, its workmen, its professions, and it must provide the community with citizens who are possessed with the proper tools of citizenship. For surely, the nation which is not governed by intelligent voters, the nation which cannot realize its productive potential, the nation which cannot hold its head high amongst its world neighbors because of a dearth of knowledge and understanding, cannot succeed.

"There has come an understanding that in this country the cause of the poverty which still remains is not the maldistribution of wealth, but a shortage of education. The more we study and ponder the nature and the dangers of our society's poverty, the more we have to face the fact that as a whole, with only some conspicuous exceptions, our system of education—public, parochial and private—is starved."

So spoke Walter Lippman recently in the Washington Post. He continued:

"My own belief is that in the days to come our paramount duty is to persuade the American voters that a second-rate system of education is no more tolerable than a second rate system of national defense."

"For they will realize that they are quite able to afford both," Lippman concludes.

How can education best serve? How can it be best guided?

This report addresses itself to a problem believed to be one of the most complex of all—vocational-technical education. Its sponsors are unswerving in their belief that there is a large deficiency in this area of education, yet are confident that the problem can be faced and overcome.

Pendulums swing in education, just as in any phase of life. We are apt to overemphasize, to catch a popular fancy, meanwhile neglecting to look hard at where the arrow should be pointed and how our values may be in need of readjustment.

Today, there is a vast need, for instance, for skilled and semi-skilled workers. Much has been said but not enough done about this. The pendulum is at the opposite side of the swing. Emphasis is given, often at the expense of vocational-technical education, to college and preparation for college.

There is, regrettably, a social stigma attached to the person who doesn't go on to college from high school, and even to the person who in high school expresses a desire not to follow that educational route.

In "From High School to Job," John Gardner, in the 1960 annual report to the Carnegie Corporation of New York, said:

> "The heavy emphasis on college is, of course, very pleasant for those whose abilities and motivations will lead them to complete four years of higher education. Until recently it was considerably less pleasant for those who wished or needed only a year or two beyond high school; but today such youngsters are increasingly well served by junior or community colleges, two-year technical institutes, and two-year programs in universities. For all other young people, the emphasis on higher education is apt to be a source of considerable strain. All too many are led to believe that in failing to go on to college they have missed the high road of American life."

To Gardner, this "is unfortunate and unnecessary. Properly understood, college or university is merely the instrument of one kind of further education for those whose interest and capacities fit them for that kind of further education. It should not be regarded as the sole means of establishing one's human worth. It should not be seen as the unique key to happiness, self-respect and inner confidence."

Gardner and others decry that today attendance at college has become the only "passport to happiness."

Our colleges are crowded to the point that physical facilities are impairing the quality of their educational offerings. But Gardner states that "the crowding in our colleges is less regrettable than the confusion of our values . . . Human dignity and worth should be assessed only in terms of those qualities of mind and spirit that are within the reach of every human being."

This following statement is reproduced from an article written by Robert W. Young, published in "School Shop News" and submitted by a local school administrator as the best statement of this problem he has ever read:

> "The person who has never engaged in work to produce or to provide materials or services cannot fully appreciate his fellow beings, most of whom work in this manner. Talking about the dignity of work is not a suitable substitute for experiencing it."
>
> "Opportunities to use logic, to solve problems, to be a functional member of a group, are abundantly present in vocational classes. These are sufficient reasons for involving all students in vocational education, but when one considers the forty percent national drop-out rate, there can be little doubt about the importance of vocational classes."
>
> "Most of the drop-outs are 'fugitives' from a college-prep program or a general education course so closely

related that the two are indistinguishable. It is also clear that colleges and universities have a drop-out problem of their own. Strangely, however, attempts to broaden education have resulted in increases in academic requirements. Paradoxically, students who need the most help are expected to gain it by indulging in more of what originally frustrated them."

In order to fully understand the scope of the problem facing school staffs in planning for the future, it seems important to review our thinking, especially in the area of the worth and value or prestige and importance of technical-vocational education.

One could ponder at length the conditions that have wrought this very present attitude—that every child must go to college or be thrown on the junk pile—but the committee chooses instead to address itself to the commanding need of providing better educational opportunity to the youth who has neither the ability, the money, nor the desire to enter a university. In fact, the committee expresses a desire for a new definition of "Higher Learning."

SCOPE OF THIS STUDY

While those who conducted this study do not think of their findings and recommendations as revolutionary, they do feel that there will have to be a change in the minds of some of the public, of some leaders, of some teachers, before the role of vocational-technical education is recognized, and a program of correction placed into action.

The panel of consultants on vocational education which reported to the President of the United States on "Education for a Changi World of Work" in 1962 pointed out that:

> "By 1970, 87 million persons will be employed full-time. Of these, 58 million now at work will still be employed; 26 million young workers will start work during the decade 1960-1970; and 3 million women will switch from housework to jobs outside the home.
>
> "Schools must help the 26 million youngsters work their way through the challenging decade now with us. Out of every ten youngsters in grade schools in 1960, three were destined not to finish high school; of the seven who did finish, three would go to work (or try to) and four would continue their education; and of the four who went on, only two would finish four years of college. Of the original 10, then, eight would not complete four years of college. In fact, six would not even attempt to."

Those who conducted this study firmly believe that more educational opportunity should be afforded those youth who are not university-oriented. This nation needs them to be productive and they need assistance in becoming productive. Sociologists, psychologists, educators all are aware of a problem, a growing social problem, a growing technological problem, a here-and-now economic crisis.

It is to this large problem, in this community, that your committee has addressed itself.

The purposes of this Cooperative Research Study of Technical-Vocational Education in the Public Schools of Lane County, Oregon, are several: (1) to provide the knowledge necessary to effect improvement in the present technical-vocational offerings in the high schools of the area, (2) to develop plans that will coordinate the high school programs with the newly-organized Lane Community College, (3) to provide the school districts of Lane County with a blueprint from which they can make valid decisions about the establishment of local technical-vocational facilities and curricula, and (4) to consider the feasibility of a central high school technical-vocational facility for the area.

No attempt is made here to dictate a lock-step curriculum, a "this is the only way" plan. Rather, this report will serve well as a guideline, a blueprint on which a curriculum for technical-vocational education can be mounted. At each turn, the curriculum has been connected with the occupational potential, and the responsibility for such development has been assigned.

We have found in this study much evidence pointing to the need for more articulation and continuity in the vocational-technical curriculum. Forty-three high schools, junior high schools and community colleges indicated that they needed help and direction in the development of such curriculum—a vacuum seems to exist.

In many instances, "lip service" is being given to technical and vocational training, simply because too few have been concerned and of those concerned not many have had the directional tools with which to work. The development of courses in this field is no easy matter; there has been little pressure to accomplish such development; and key officials in the various school systems admitted themselves to be in somewhat of a quandary.

This report, we believe, will initiate the proper steps and provide guidance to the goal desired: an integrated, coordinated educational system designed to provide our youth with not just an alternative to "university" but good training leading into the many vocational and technical fields this community and this nation needs.

ARTICULATION

The major specific conclusion of this report is that vocational-technical education be integrated and coordinated as rapidly as possible grades seven through fourteen in and between the various educational institutions of the Lane County region. One word has been used to describe this integration and coordination, the word "articulation." Since this study has devoted so much emphasis to the subject of educational articulation, it is essential to give definiton to the term.

The term "articulation" means the act of joining parts, or the condition of being joined or jointed. Bone articulation is considered poor if after injury the bones do not connect as smoothly and function as well as before. Artic-

ulation is considered good if the joint functions smoothly and efficiently.

Articulation in education has been most frequently used in the sense of transition from one school unit to another: elementary school to junior high school, junior high school to high school, high school to community college or university.

The term has also been used to describe relating learning experiences from one situation to another, e.g., learnings in one curricular area, let's say social studies, may seem unrelated or even contradictory to learnings in another curricular area such as industrial arts or natural sciences. The term can also mean a smooth flow or connecting of experiences within a single subject area on a day to day basis.

Articulation as used in this report encompasses all of these meanings. It can mean the problems young people face when moving to a new school community, it can mean the student frustrations developed from school subject matter that is contradictory and confusing, it can mean the educational linkage between grades, schools, different school communities and levels of education.

OCCUPATIONAL EDUCATION

Another term used often in this report is "occupational education." There are 23,000 different occupational titles in the United States. Some 6,000 of these occupations have been born within the last 12 years alone. Education for the professions has long been provided as a part of the total educational program. However, education for other occupations is neither as time honored nor as well developed in the American educational system.

Occupational education is often begun in the senior high school and continued in community colleges, apprenticeship programs, on-the-job training programs, and technical institutes. Federal legislation aids occupational education in six major areas: agriculture, distributive occupations (all aspects of marketing), homemaking, industrial fisheries, practical nursing, and other non professional health occupations, trades and industry (machine shop, auto repair, plumbing, food service, sheet metal, barbering, carpentry, drafting, and other highly skilled technical occupations).

Many other forms of specialized occupational education have developed, including business education and various forms of technical education outside the industrial field.

Like the professions, all of these occupations are vital to American life. The school system that has as its objective to prepare the student for life in the United States cannot ignore the non-professional occupations.

This committee likes the term occupational education rather than vocational-technical education becaause it is more descriptive for our purposes. The two phrases have been used interchangeably in this study.

WHAT THIS STUDY DID NOT DO

The statement has been often made that specific occupational training programs in high school tend to force students into early career choices which they are not adequately prepared to make. In fact, a brief analysis of this problem has been included in this study (Chapter V).

This study makes no attempt to force specific early occupational choices. Even as students now must plan for their next educational step this study suggests an orderly occupational education program that will offer students many alternatives without missing many steps (pages 14-15). A plea is made here for adequate vocational guidance that will help students set broad goals. This study is suggesting an occupational training program that will help a host of students to attain their realistic goals.

This study does not delay occupational training until post high school. A recent survey of businesses undertaken by the Pittsburgh, Pennsylvania, Chamber of Commerce, the Pittsburgh Employment Office, and the Pittsburgh Board of Education pointed toward the fallacy of delaying occupational education until after high school. They found:

(1) In order to meet the recruiting requirements of industries currently operating in the Pittsburgh area, 109 vocational programs are needed of which 48 can be provided within the high schools in the area, 61 require post-high school programs. This was as evaluated by the industries themselves.

((2) Educational requirements by industry for future job placements were:

a. 6% require less than high school education.
b. 14% require general high school education
c. 23% require high school graduation including specialized training, such as clerical, business, distributive occupational or vocational.
d. 33% require one to three years of post-high school education and training
e. 24% require four years or more of college training.

(3) To meet the requirements of the future, it was determined in this survey that Pittsburgh high school graduates should be trained approximately in the following amounts:

a. 20% in occupational programs
b. 20% in vocational programs
c. 20% in pre-technical programs
d. 40% in college preparatory programs

It is interesting to note that less than 4% of the high school students in Pittsburgh attend vocational schools at the moment. At least 20% should be in such programs at the high school level and 20% in technical programs leading to post-high school education. In addition, 20% of the student population must be trained in semi-skilled occupational areas in high school in order that they will have something to sell when they complete the amount of formal education they are able to take.

This Lane County study has not attempted to indicate what percentage of students should enter given programs, but only that programs should be available in the students' own social setting.

This study committee has not suggested a separate occupational curriculum, but rather an integration of general education with occupational education. Patterns have been suggested and programs outlined, but they all call for liberally educated students. This committee does, however, press for educational experiences that relate more directly to life, and general education courses that connect the practical with the abstract. Even as the so-called college bound student is told he must take this, this, and this in order that he may enter the college of his choice, so must the student desiring to enter a non-professional occupation be given guidance in preparing for entry into that occupation.

The view of occupational education as an integral part of general education holds large potential for future study and development. Motivation of students has long been a problem in education. Perhaps as general education relates more closely to occupational needs, the interest and energies of many students will rise concurrently.

A RAPIDLY CHANGING OCCUPATIONAL STRUCTURE IN AMERICA COULD LEAD TO AN EDUCATIONAL DISASTER GAP. MANPOWER PROBLEMS ARE REALLY EDUCATIONAL PROBLEMS.

CHAPTER II — THE OCCUPATIONAL PICTURE IN LANE COUNTY

Lane County, Oregon, is located in western Oregon midway between the Columbia River and the California stateline. It runs 120 miles from the Pacific Ocean on the west, crosses the low, wooded coast range, spans the upper end of the fertile Willamette Valley, and extends to the summit of the rugged, heavily-timbered Cascade Mountains on the east. The more mountainous area of the county is covered with virgin and second-growth Douglas Fir forests; about one third of the county's area is fertile valley floor.

The county's population is centered in the valley; the largest urban area and major trade center is the Eugene-Springfield area where nearly 60 per cent of the population lives. The county, roughly the size of the state of Connecticut, has a total population of just over 190,000.

From the time that Eugene Skinner built his first cabin here in 1846, lumber has been the backbone of the area's economy and still is, despite a substantial diversification of economic activity.

Population growth here has been rapid in recent decades. In 1930, there were 54,493 people living in the county; by 1940, 69,096. The war and post-war years brought a large migration to the Northwest and Lane County reflected this immigration: in 1950, 125,776 persons lived here—by 1960, this figure was 162,890, a growth of nearly 30 per cent in just ten years. By 1964, population was more than 190,000.

With a labor force of 72,000 persons, the county is the second largest labor market in the state and the fifth largest in the Pacific Northwest!

In most respects, the economic structure of Lane County is similar to other metropolitan areas throughout the country, and is subject to the same forces which are changing the job structure of the nation.

But, in at least one respect, Lane County is exceptional. The recent economic growth of the county has been truly outstanding. This is the fastest growing economic area in Oregon, and its employment is expanding at nearly three times the national rate. The effect of this on the educational picture will be shown later; it is great.

While the employment rate in the nation grew 7 per cent from 1959 to 1964, Lane County's grew 20 per cent. This compares with 12 per cent for Portland, 9 per cent for Salem, and 9 per cent for the state as a whole.

The level of prosperity during the single year of 1964 exceeded all but the highest expectations. Employment increased 5 per cent during the year to a record 68,800, continuing the trend that produced the 20 per cent increase in the five year period. Manufacturing payrolls are now nearly half again as large as five years ago.

While to a large extent this growth is the result of the rising national economy, it also reflects the county's own growth as a center for transportation, trade and education.

This economy has provided well for the growing population. The median annual income for the county rose 70 per cent from 1949 to 1959. So the economy not only supported 30 per cent more people, it provided each family with a substantially higher money income. (The consumer price index rose 23 per cent while the median income went up 70 per cent.)

Unemployment, a serious national problem, has not been so acute in Lane County. With only one exception, the county's rate of unemployment has been below the rest of the state and the nation for the past five years.

While the rapid growth of the economy has eased the area's unemployment problem, it has also made the supply of trained manpower more crucial yet harder to maintain. The rapid expansion of certain industries has long since used up the supply of experienced personnel and has forced employers to hire and train new workers. A conservative estimate indicates that there are currently about 500 persons in training positions with the county's businesses, and the need is not being fully met.

There exists in this community an urgent need for better technical and vocational training, and, happily, there is also present a splendid opportunity.

Education has always been a crucial element in the employment process and each day this is more evident. No man is born knowing how to work, each must learn the skills he will use to earn his livelihood and pursue his happiness. And of course the man who learns most, does the best.

The better educated man is the more likely to find his job, to be able to keep it and to earn a good living while doing it.

The tie between education and employment is stronger today than ever before and will be stronger in the tomorrows than today. As knowledge grows and productive systems change, education becomes more than an element in the employment process; it indeed becomes a prerequisite.

The question of the day is not whether vocational-technical education will be provided, but how, for it must be. Industry's traditional, in-plant training is no longer sufficient. Moreover, vast numbers of young people—the baby boom of the 1940s—are coming into the labor market. To prevent a surplus situation, to employ the mass of job seekers in a productive manner, the nation has turned to the school system, a system which in many cases is not geared to meet the demand.

The consensus today is that the schools are best able to provide the fundamental skills necessary if their graduates are to succeed in the labor market. Thus, this education for work is falling in line with the historical educa-

tional aims of equipping young people for successful living and responsible citizenship.

Changing technology and changing markets are bringing about a gradual transformation in the area's economic profile. While most industries have grown, the growth does not extend equally to all types of business activity.

GOODS-PRODUCING INDUSTRIES

The lumber industry is the largest of all goods-producing industries in the county and accounts for 22 per cent of its employment. Here, the county is an exception, for its expansion took place during a period when lumber employment was declining in other areas of the state. The industry's employment increased 18 per cent in the past five years, a growth credited to the expansion of advanced wood processing, notably in the making of plywood. Without this exceptional growth, employment would surely have declined.

Lumber industry technology is constantly improving in this county. In a recent study of mechanization and manpower needs in sixteen large plywood plants in the area, the Oregon State Employment Service found that over half had installed at least one major piece of new equipment within the past year or had definite plans to modernize their plants.

To date, most technological advances have been absorbed without a serious loss of jobs, but such changes require an adaptable work force.

These industry trends have important consequences for the structure of jobs. On the one hand, jobs are more stable, and seasonal unemployment, though serious at times, is gradually becoming less severe. But equally important is the obvious trend toward higher skill requirements. While the lumber industry is by far the largest source of unskilled jobs here, skilled production jobs in lumber firms are growing twice as fast as unskilled jobs. The difference is expected to become even greater in the near future; also important is that non-production workers are accounting for a major share of the newly-created jobs in the lumber industry.

Other goods-producing industries are undergoing equally important employment alterations. Though they employ but 2,100 persons, metals, paper, publishing and other manufacturing firms have grown substantially in recent years.

These firms require a large proportion of highly skilled workers and their growth has substantially increased the need for metal and machine trades and other skills in this area.

A continued growth of such manufacturing, and the ensuing demand for skilled labor, is expected. Machinery and chemicals for the lumber industry will be increasingly needed. Moreover, the population growth brings the requirement for more foods and beverages, more printing and more of the various other manufactured goods produced locally.

Construction activity has run at a rapid pace for ten years or more. Such employment has increased a fourth in the years 1960 to 1965, spurred by a combination of federally financed hydroelectric projects and local demand for housing and commercial buildings. This industry provides 800 more jobs now than five years ago and skilled craftsmen are essential to the construction industry. This demand will increase as the industry grows.

The only industry in which unskilled jobs are growing faster than skilled is agriculture. The increased plantings of crops such as berries and nuts, which require a large amount of temporary harvest help, have produced this unusual situation.

All in all, these goods-producing industries employed about 27,000 people. Because of increased productivity, the number of jobs in these goods-producing activities has risen less rapidly (16 per cent in five years) than have those in the distributive field (20 per cent) and service industries (36 per cent).

DISTRIBUTION

The firms engaged in the distribution of goods and services employ some 21,000 people in Lane County. They include the rail, motor and air transport carriers, the communication firms such as newspapers, radio and television stations and the non-governmental public utilities.

Distribution includes both wholesale and retail trade and sales in financial institutions, real estate and insurance firms.

All in all, this activity accounts for a third of our employment and it is a rapidly growing segment. In the past five years, employment in these industries has grown twenty percent, a gain of 3,500 jobs.

Take the growth of retail trade: there has been at least a 49 per cent increase in retail sales during the five years from 1958 to 1963. During the 1960-1965 period, employment in wholesale and retail trade firms rose 2,400 and is expected to grow another 1,100 in the next two years.

But it is not growth so much as change that is the point here. These firms demand a high-type employee, one that can meet and influence people and one that can adapt to a changing environment.

In the banking industry, the volume of checks written against accounts in Eugene rose 14 per cent during the year 1964 alone. This volume, here and nationwide, has caused the financial institutions to turn to mechanical sorting, routing and record-keeping equipment. Hardly anywhere else has so much been done to mechanize systems. The impact on jobs has been substantial—more and more personnel must be familiar with the office equipment which performs routine clerical duties.

Eugene's strategic location as a trade center for southwest Oregon and its importance as a major producer of timber products makes it an equally important transportation center. The city is now the center of all Oregon operations for the Southern Pacific Railroad and its yards in Eugene handle an average of sixty trains a day. The area is also served by the Oregon Electric Railroad and numerous other lines have offices in the Eugene area.

Here again, in the transportation industry, as well as in the communications field and public utilities, management has installed machines for the sake of efficiency and the employee must know how to run them and work with them.

So, in the distributive industries, the financial institutions and others, there is a large demand, a growing demand for trained people—clerks who can work with mechanical aids, sales personnel who can deal with people in a helpful, business-like manner, and technicians who can work with mechanical aids in order to increase their productivity.

SERVICE INDUSTRY

The remaining third of our employment is engaged in service industries. These include personal services, maintenance and repair, recreation, education and professional services.

Many service persons are self-employed and many firms are small. Employees perform many tasks in addition to their own specialties. A skilled repairman, for instance, often must wait on customers, do some record-keeping and deal with other personnel.

Included in the service category is education, a major source of employment in Lane County, as well as other governmental activity.

Of the three categories, goods-producing, distributive, and service, this latter is the most expansive. Growth among these firms has created a 36 per cent increase in jobs over the five-year period ending in 1964. Greater gains are expected in the future, as the other industries attract more people to the region.

Education by itself today represents one of the county's largest industries. Each September brings 2,000 additional students into grade and high schools over the previous September. Public school enrollments now exceed 48,000; in five more years, this figure will exceed 55,000.

At the same time this increase in public school enrollment has burgeoned, the University of Oregon has developed into an institution with 12,000 students and a staff of 2,600.

Constantly, the demand is increasing on the school systems, and they in turn need more teachers, administrative and service personnel.

In the other service types: personal, professional, business, repair, amusement-recreation and so on, the same growth has been recorded and is anticipated. It is estimated that in these endeavors, there will be 300 new jobs created each year for at least the next two years.

The trend is a movement away from the simple handling and processing of material; rather, it is a movement toward jobs which involve some significant relationship to people.

In summary: there is little reason to believe that the period of rapid and diversified growth in our economy will be short-lived. Expansion will remain the vital force and mechanization will be the instrument.

As is true generally, the goods-producing industries, although vital to the economy, are not creating employment at the same rate as the distributive and service industries. Yet they by themselves are creating a new labor market—they need fewer unskilled yet more skilled workmen.

Even if the overall skill level were not rising—and it is—the rapid changes occurring in the economy require a great deal of adaptability in the work force. Ewen Cleague, Commissioner of Labor Statistics for the U.S. Dept. of Labor, has said:

> "I see a growing need for a better-educated work force. A good background is becoming more essential, even for those in the least-skilled jobs, in order to enable the individual workers to make frequent shifts as technological and other factors increase the tempo of industrial change. This is true, not so much because the duties performed in these occupations require more skill than they did a decade or two ago, but because in our rapidly changing economy, workers in these types of jobs are faced with frequency of change—from one occupation to another, from one employer to another, from one environment to another. Employers prefer the worker who can not only perform the immediate job, but who can learn quickly to operate new equipment or perform new functions and adjust to technological changes."

Consequences for the community must not be overlooked. National data show, for instance, that unemployment among persons with less than a high school education is fully four times as high as among college graduates and at least half again as high as among those who complete high school.

Also, the educational level of the work force is important to the community which wants to compete for new industry.

More and more women and young persons make up the Lane County labor pool. A woman returning to work after raising her family needs training, else she goes onto the unemployment roll. So it is with the very young. It behooves the community to offer these persons good vocational guidance and education. It is an investment with great chance of return.

It is difficult for the very young to find a job—he must compete with older persons. If, in addition to being young, he is also untrained and unskilled, then his chance to compete is slimmer even yet. In the United States as a whole, the unemployment rate for workers in their early twenties is twice as high as among older workers, and teenaged workers are at least three times as likely to be unemployed as are their older counterparts. In this young age bracket, as nowhere else, technical and vocational education is a paramount need.

John P. Koval, Chief of Research Operations for the Lane County Youth Project, by using a system of questionnaires, followed a group of Lane County high school seniors from the time of graduation until they were two years out of high school.

He found that most were "wandering around" during the first few months after graduation; that very few realized their ambitions in the two years; and that the majority of females and 44 per cent of males had a major change in status from the first year to the second.

> "For some, this represents a necessary and desirable testing of oneself and the 'real world'," he summarized.

"For others, this change probably represents a 'reality shock' in the form of an inability to succeed in college and dropping out, or chronic and sporadic unemployment. For this latter group of graduates a teen-age dilemma has turned into a young adult trauma."

This wandering around, this indecision and the resultant unemployment, represents a loss both to the individual and to the community. Later in this study, a case is made for better counseling, as well as for better articulated technical and vocational education.

CHAPTER III — SUMMARY OF RECOMMENDATIONS

- **BETTER ARTICULATION AND ASSIGNMENT OF RESPONSIBILITY**

If the Lane County region is to take full advantage of all the educational institutions in the area, and if vocational-technical education is to achieve any degree of articulation; it is vital that some assignment of responsibility be made.

- **SECURE MORE QUALIFIED TECHNICAL-VOCATIONAL TEACHERS**

All of the surveying, analyzing, planning and other preparing for an expanded system of technical-vocational education will be nearly useless unless one main consideration is faced squarely: where and how to get adequate technical-vocational teachers?

- **PROVIDE ADVANCED PLACEMENT OPPORTUNITIES FOR TECHNICAL-VOCATIONAL STUDENTS**

Past experience by students, colleges, and high schools indicate that the advanced placement program, which allows the student to work and study at an advanced level, can be of value to students, can improve the quality of instruction, and has caused few problems.

With the cooperation of labor, business, industry, secondary schools and community colleges, such a program could be developed for technical-vocational education at the 12th grade level.

- **ISSUE COMPETENCY CERTIFICATES REPRESENTING MINIMUM JOB ENTRY SKILLS**

As an incentive to the student and as advice to his or her prospective employer, schools should consider issuing competency certificates. These should be based on objective test data and demonstrated performance skill in a specific area, and would be an indication of competency to enter the labor market with a minimum job entry skill.

- **HIRE A REGIONAL TECHNICAL-VOCATIONAL CONSULTANT**

Employment opportunities do not follow school district boundary lines. Employment and preparation for employment are regional problems larger in scope than any one school district.

There is a need for a person who is knowledgeable about and responsive to local needs to spend full time in Lane County to aid schools in developing their technical-vocational programs.

- **REJECT THE SINGLE AREA CENTER CONCEPT—ESTABLISH SUB AREA CENTERS**

The alternative of putting selected technical-vocational curriculums in certain high schools within the geographic area normally served by a single central vocational school will to a large extent overcome the handicap of labeling technical-vocational students as "non college bound."

In order to accomplish the sub area center plan, it will be necessary to arrange inter-district transfer of students without an overwhelming financial burden on any of the districts involved.

- **INITIATE COOPERATIVE WORK-EXPERIENCE PROGRAMS WITH BUSINESS AND INDUSTRY**

Cooperative work-experience education is a school directed program through which students obtain practical experience in producing useful goods and services. This experience must be a part of the regular school curriculum in addition to academic learning. The work situations may be in business, industry, the community at large, or in the school.

- **ANALYZE THE ADEQUACY OF LOCAL VOCATIONAL GUIDANCE PROGRAMS**

Some discussion must take place among all school personnel, grades one through fourteen, about their own attitudes toward vocational-technical education. Vocational guidance is the responsibility of all teachers and administrators at all levels of education; it cannot be delayed until grade ten. How well do primary teachers understand the aims and needs of technical-vocational education?

- **DEVELOP TECHNICAL-VOCATIONAL LIBRARIES**

Adequate inventories of library materials, instructional materials, and occupational information are conspicuous because of their absence in most secondary and higher schools of Lane County. The shortage of building code manuals, trade journals, periodicals, current technical-vocational bulletins and manuals, up-to-date curriculum guides, is one of the major problems facing teachers and administrators in development of technical-vocational courses.

- **COORDINATE APPRENTICESHIP PROGRAM WITH SECONDARY SCHOOL AND COMMUNITY COLLEGE CURRICULA**

It should be pointed out that apprenticeship programs in Lane County have operated in a cooperative and friendly manner with the schools. However, just as there is little relation between the secondary and community college curriculums, the apprenticeship program is usually unrelated to the individual's prior education at the secondary school and community college level.

- **WELL DEFINED POLICY IS NEEDED FOR PUBLICLY SUPPORTED OCCUPATIONAL EDUCATION**

The development of a coherent policy defining the nature and extent of public responsibility for occupational education is needed. Questions such as the boundary between public and private responsibility; on-the-job training vs. institutional programs; the role of different public agencies, must be answered.

TABLE 4

PROGRAMS FOR GRADES 10, 11 AND 12 IN LANE COUNTY SCHOOLS

In Grades 10, 11 and 12 every student could enroll in a special program. The programs outlined here follow the blueprint for technical vocational education proposed by Lane County Research Study. Not every Lane County school will offer the courses proposed. A student wishing to take a course not offered at his school could apply for a transfer to a school offering the course; a student wishing to take advantage of this arrangement should consult his school counselor.

ENGINEERING AND TECHNICAL

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9
- Science 8 & 9
- French, German, Spanish, or Russian
- Industrial Arts
- Orientation to Careers

All students must take:
- English 10, 11 & 12
- Modern Problems, U.S. History
- P.E. 10 & 11
- Biology
- Math

All students on this program must take:
- Algebra and Geometry II
- One of Chemistry, Physics
- One of French, German, Spanish, Russian

All students on this program must take a Specialty

ART SPECIALTY

Three courses from the following:
- Art I & Drafting I
- Applied Design
  - Drawing & Painting
  - Commercial Design
  - Graphic Design
- Advanced Art
- Advanced Design

SECRETARIAL SCIENCE AND BUSINESS MANAGEMENT

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9 or alternate courses
- Science 8 & 9 or alternate courses
- Typing
- General Business
- Orientation to Careers

All students must take:
- English 10, 11, 12
- U.S. History, Modern Problems
- P.E. 10 & 11
- Biology
- Math

All students on this program must take:
- Business Law
- Business English
- Principles of Data Processing

All students on this program must take a Specialty

SECRETARIAL SPECIALTY

All students in this specialty must take:
- Typing I & II
- Shorthand
- Adv. Shorthand or Stenography
- Office Management
- Office Practice
- Business Machines (Including Automation)

PRODUCTION AND CONSTRUCTION

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9 or alternate courses
- Science 8 & 9 or alternate courses
- Industrial Arts
- Orientation to Careers

All students must take:
- English 10, 11 & 12
- Modern Problems, U.S. History
- P.E. 10 & 11
- Math
- Biology

All students on this program must take:
- Consumer Mathematics
- Business Law
- Lumber Economics

TIMBER PRODUCTS SPECIALTY

All students in this specialty must take:
- General Forestry
- Basic Agriculture
- Ag. Science
- Adv. Forestry (Including Safety)

CONSTRUCTION SPECIALTY

All students in this specialty must take:
- Drafting I & II
- Construction I & II
- Industrial Science
- Tool Care and Maintenance
- Welding

SERVICE OCCUPATIONS AND DISTRIBUTION

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9 or alternate courses
- Science 8 & 9 or alternate courses
- Gen. Business
- Orientation to Careers

All students must take:
- English 10, 11, 12
- U.S. History, Modern Problems
- P.E. 10 & 11
- Math
- Biology

All students on this program must take:
- Business Law
- Business English

All students on this program must take a specialty:

FOODS SPECIALTY

- Home Economics
- Adv. Home Economics
- Consumer Math
- Typing I or another commercial course
- Nutrition
- Basic Agriculture

DISTRIBUTION SPECIALTY

- Retail Selling
- Typing I
- Bookkeeping

PRODUCTION AND PROCESSING

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9 or alternate courses
- Science 8 & 9 or alternate courses
- Arts & Crafts, Introduction to Arts
- Gen. Business
- Orientation to Careers

All students must take:
- English 10-11-12
- U.S. History
- Modern Problems
- PE 10 & 11
- Math
- Biology

All students on this program must take:
- Algebra or Consumer Math
- Applied Chemistry or Physical Science
- Business Law

DATA PROCESSING SPECIALTY

- Intro to Data Processing 11-12
- Key Punch
- *Machine Operation & Repair
- *Programming & Computer Theory

TEXTILES SPECIALTY

- Home Economics
- Adv. Home Economics
- Textiles I
- *Tailoring
- *Seamstressing
- *Garment Care
- Upholstery
- Applied Chemistry

MECHANICAL

Requirements to Enroll:

Grades 8 & 9 completed including:
- Mathematics 8 & 9 or alternate courses
- Industrial Arts
- Gen. Business
- Orientation to Careers

All students must take:
- English 10, 11 & 12
- Modern Problems, U.S. History
- P.E. 10 & 11
- Math
- Biology

All students on this program must take:
- Consumer Mathematics
- Drafting I & II
- Business Law

AUTO & DIESEL SPECIALTY

- Power Mechanics
- Basic Electricity
- Welding
- Auto Maintenance

AIRCRAFT & JET SPECIALTY

- Algebra I & II
- Power Mechanics
- Basic Electricity
- Welding

SCIENCE SPECIALTY

Three courses from the following:

- Adv. Math or Algebra II
- One of: Chemistry, Physics
- One more science course from Biology II or Electronics

TECHNICAL SPECIALTY

Three courses from the following:

- Adv. Math or Algebra II
- Speech
- Drafting I, II
  - *Applied Electronics
  - *Appliance Repair

PROGRAM LEADS TO

Universities, Community College, and Technical Vocational Schools provided the admission requirements are met. Students are advised to become familiar with these requirements. Information is available from school counselors.

ACCOUNTANCY SPECIALTY

All students in this specialty must take:

- Typing I & II
- Business Math
- Bookkeeping I & II
- Accounting I
- Office Management

CLERICAL SPECIALTY

All students in this specialty must take:

- Typing I & II
- Business Math
- Bookkeeping I
- Office Practice
- Office Management
- Business Machines

PROGRAM LEADS TO

direct employment, Community College and vocational schools provided the admission requirements are met. Students are advised to become familiar with these requirements. Information is available from the school counselors.

MECHANICS SPECIALTY

All students in this specialty must take:

- Drafting I & II
- General Metals I & II
- Power Mechanics
- Intro to Auto Mechanics
- Welding

ELECTRICAL SPECIALTY

All students in this specialty must take:

- Drafting I & II
- Power Mechanics
- Basic Electricity
- Electronics I
- Welding

PROGRAM LEADS TO

direct employment, apprenticeship training, vocational schools, Community College provided admission requirements are met. Students are advised to become familiar with these requirements. Information is available from school counselors.

HOME CARE & INDUSTRIAL SERVICES

- Home Economics I & II
- Textiles I
- Vocational Homemaking
- Child Care
- *Hotel, Motel, Resort Management
- *Institutional Cleaning & Maintenance
- *Practical Nursing

HEALTH SPECIALTY

- Chemistry
- Algebra & Geometry
- One of French, German, Spanish, Russian, Oriental
- Biology II

LAW ENFORCEMENT SPECIALTY

- Typing I & II
- Speech
- First Aid & Safety

PROGRAM LEADS TO

direct employment, vocational schools, Community College provided the admission requirements are met. Students are advised to become familiar with these requirements. Information is available from the school counselors.

LUMBER PROCESSING SPECIALTY

- Gen. Forestry
- Lumber Economics
- First Aid & Safety
- Basic Electricity or Drafting
- Applied Chemistry

GRAPHIC ART SPECIALTY

- Photography
- Drafting I & II
- Art I & II
- Commercial Design
- Applied Chemistry

PROGRAM LEADS TO

direct employment, vocational schools, Community College provided the admission requirements are met.

WELDING SPECIALTY

- Gen. Metals I & II
- Welding
- Algebra

SMALL ENGINE SPECIALTY

- Power Mechanics
- Basic Electricity
- Electronics I
- Welding

MACHINE SHOP SPECIALTY

- Gen. Metals I & II
- Welding
- Algebra I

PROGRAM LEADS TO

on-job apprenticeship training, vocational schools, and direct employment. Information on apprenticeship training and on further educational opportunities is available from school counselors.

Career Training Opportunities Offered by Lane Community College

- Civil & Structural Engineering
- Electronic Engineering
- Radio & TV Broadcasting
- Forestry Aide
- Mechanical Technology
- Chemical Technology
- Lab. Technology
- X-Ray Technician
- Instrumentation
- Technical Drafting
- Graphic Arts

- Secretarial Science
  - Legal
  - Medical
  - General
  - Lumber
  - Educational
- Mid-Management
- Data Processing
- Bookkeeping
- Insurance
- Real Estate
- Retail Selling

- Cabinet Making
- Carpentry
- Metallurgy
- Forestry Aide
- Civil & Structural Engineering
- Electronic Engineering
- Machine Shop
- Technical Drafting
- Heavy Equipment
- Trade Apprentice
- Upholstery, Commercial
- Heavy Construction
- Medium Construction

- Law Enforcement
- Practical Nursing
- Dental Assistant
- Instructional Aide
- Nurses Aide
- X-Ray Technician
- Nursing R. N.
- Culinary Arts
- Hotel-Motel Management
- Fireman
- Retail Clerk
- Salesman
- Service Station Oper.
- Insurance Adjustment
- Health Careers

- Commercial Art
- Photography
- Graphic Arts
- Sign Painter
- Key Punch Operator
- Data Process Machine Oper.
- Programmer
- Tailor
- Seamstress
- Clerk
- Upholstery
- Sawmill Worker
- Plywood Worker
- Pulp & Paper Worker

- Airframe & Power Plant Mechanics
- Appliance Repair (large & small)
- Auto Body & Fender
- Auto Mechanics
- Metallurgy
- Diesel Mechanics
- Machine Shop
- Radio & TV Repair
- Technical Drafting
- Welding
- Trade Apprentice
- Marine Mechanics
- Office Machine Repair
- Vehicle Maintenance & Operation

*Offered by Community College to selected High School seniors.

SOME RECOMMENDATIONS AND UNANSWERED QUESTIONS

This chapter is somewhat of a potpourri of recommendations and unanswered questions. It is intended to supply food for thought as well as concrete recommendations for the area.

This study committee is recommending a "job cluster sharing plan" with a coordinated vocational-technical curriculum pattern for all high schools in Lane County. The community college must also share in this coordination. The significant elements of this plan are:

1. There must be much cooperation among various school districts.
2. The Community College must be willing to enroll for specific courses some high school seniors.

DIVISION OF RESPONSIBILITY AMONG VARIOUS INSTITUTIONS

In order to use the job cluster teaching approach, it is necessary to define the areas of responsibility for our teaching institutions. Each level, each school, must be aware of such duties and how it fits into the general pattern.

The junior high school is for exploratory and general education programs, the high school for further exploration plus specific, terminal education, the community college for teaching of the higher skills.

It is clear, by the national trend, that the community college is to be the hub of the whole technical-vocational educational system of tomorrow. Most high schools cannot offer the variety of programs needed, and more and more courses beyond high school will be desired.

Employers seem to favor the older employee and the person who has taken his vocational training at a post high school institution. This is not to negate the value of such training at high school, but more to bring into focus the rather "new" concept of community college. Generally, this college will have better staff and better services to teach the more specialized skills.

Adults, of course, will favor the community college over the high school, and many high school students will want to postpone their advanced training until they are ready for the community college.

With Lane Community College becoming an area-wide institution, it becomes most imperative that there be a great deal of coordination in this field.

What follows here is the outline of a system that is flexible and yet lends itself to a minimum of duplication of effort and money.

Much time and effort will be saved by the public school districts of Lane County by having such a blueprint for the future.

1. Every high school, regardless of how small or large, should offer course work leading to occupations in the secretarial science and business management field. The Community College should offer courses which build on these high school classes.

2. In the Technical-Mechanical Field, programs should be limited to certain large schools and the Community College. Most students would take their regular courses at their own high school and attend half-day sessions at a nearby, larger high school or at the Community College. They would remain members of their home student body and participate in local activities, and simply attend the other institution for technical-mechanical course work. Tuition agreements could be arranged between school districts. Costs should be worked out according to guidelines laid down by the State Department of Education.

3. High schools now offering an agricultural program should continue but also investigate addition of courses in landscaping, horticulture, farm machinery maintenance and sales. Eventually, as agricultural occupations decrease, such teaching should be confined to a few select large high schools. Students from smaller schools would attend these classes on a part-time basis.

4. Timber products courses should be offered in every high school in Lane County. This is the major industry and much more should be done to familiarize students with the timber economy and the job potentials of this industry.

The timber products curriculum as presented in the appendix to this report is a sample of the type of instruction program that could be developed in grades seven through fourteen. This curricular outline is not a developed, fully sequenced curriculum, but rather, a sketchy outline, a starting point. It is geared to meet the needs of the timber industry. This program could lead to the development of a minimum job entry skill at the completion of the 12th grade, or could be aimed at further development of forest technology at the community college level.

5. The study committee believes that every Lane County high school could offer a metal products curriculum. Students should at least know about job opportunities and necessities to succeed in a metal products job cluster.

6. It is recommended that a course, such as "Introduction to Construction Skill" now being offered at Cottage Grove High School, be considered by all senior high schools of Lane County. In view of the varying needs of light, medium and heavy construction, the present wood shop curriculum is not meeting the manpower needs of the construction industry. It is recommended that the junior high school wood shop program be exploratory and that the grade 11 and 12 wood shop program be designed to prepare students for job entry skill into the construction industry.

7. In the two job clusters of service and distribution much of the basic job entry education can be done at the high school level. Specific occupational training could then be developed by the Community College.

What follows here is an assignment of training and education responsibility by job cluster. If the Lane County region is to take full advantage of all the educational institutions in the area, and if vocational-technical education is to achieve any degree of articulation, it immediately becomes apparent that some assignment of responsibility is necessary. It should be emphasized again that the committee does not intend to dictate a lock-step curriculum. Rather, this report is intended to serve as a guideline, a blueprint from which a curriculum for technical-vocational education can be developed.

WHERE AND HOW TO GET VOCATIONAL TEACHERS

All the surveying, analyzing, planning and other preparing for an expanded system of vocational teaching will be useless unless one main consideration is faced squarely: where and how to get adequate vocational teachers.

Despite the growing recognition of the need for more and better vocational preparation, including considerable attention and some financing by the federal government and the Congress, the recruiting and retention of competent vocational instructors has been unsuccessful. Thus, it has slowed down the desired development of programs.

Two major factors must be considered: There is a high market demand for people qualified to be vocational teachers and since they possess different and more varied qualifications they are different, and as such must be judged and paid differently than academic teachers.

In our competitive market situation, business and industry seek the services of the same type of individual that education seeks as vocational teachers. Therefore, school systems must offer salaries to potential vocational instructors that are competitive with those offered by the private segment.

There are many persons now in industry who would like to teach, who are attracted because of the satisfaction of rendering public service. But they don't teach because the lesser salary offered by education makes it too great a sacrifice.

But schools can compete and in many areas are doing so. And the systems doing it are keeping the uniform salary schedule as desired by most school districts today.

What must be done is to give trade and industrial educators credit for their different but necessary training and experience.

The American Vocational Association has published a brochure called "Salary Incentives for Teachers of Industrial and Distributive Education," which gives a number of examples of successful methods used to attract and retain competent vocational educators.

The Association's proposed solution can be related to the present situation in Oregon and Lane County.

The uniform salary schedules in effect in Lane County and most of Oregon are generally based on the accepted pattern of academic preparation required for academic teachers plus the number of years of teaching experience the teacher has. Reprinted below is an example of a fairly typical salary schedule.

Years of Exp.	Level	Bachelors	Masters
0	1	$5,000	$5,400
1	2	5,200	5,625
2	3	5,400	5,850
3	4	5,600	6,075
4	5	5,800	6,300
5	6	6,000	6,525
6	7	6,200	6,750
7-8	8	6,425	7,000
9	9	6,650*	7,250
	10	6,875	7,500
	11	7,100	7,750
	12	7,325	8,000
	13	7,550	8,250
	14		8,500
			8,750

*Highest Entering Salary

Note there is no provision for placement of a teacher who has not attained at least a bachelor's degree, therefore there is no set schedule, no allowance, for a person without that formal distinction.

It takes about four years of study at a recognized university to attain a bachelor's degree. It takes from four to six years of schooling, on-the-job training, apprenticeship or a combination of all to produce a skilled person in trade or industry, a person capable of teaching a vocational-technical program, using his education and experience.

Where in this salary schedule could a person with the background necessary to teach a vocation be placed? How, in other words, can we equate experience with formal education on a pay scale?

In Oregon an individual must have had at least three years of experience beyond the four years learning period (sometimes this is longer) in order to hold a certificate to teach vocational training. This adds up to seven years, about the same length of time generally recognized as necessary for an academic student to get a doctorate.

Seven years, and yet an unimaginative application of the uniform salary schedule would offer this person $5,000 a year starting salary. In many school systems, he would not be allowed to teach, or if he did he would be offered less money, because he does not hold a bachelor's degree.

This same individual, having spent seven years in his chosen field, has established himself in his field at a salary considerably higher than the teacher's beginning salary. Frequently he has a salary higher than the highest pay on the teacher's salary schedule.

Some school systems have found a simple solution to this dilemma. With some variations, they generally follow the rule that each year of training is weighted the same

as a year of college, and that each year of experience in work is weighted equally with a year of experience that a teacher receives.

Also, some systems provide the vocational teacher with opportunity to attain the educational training as he teaches. This is vital and must be faced squarely by school districts and training agencies.

The American Vocational Association has said:

> "There has been much talk in America about the dignity of work and yet in practice, deference has always been shown the man with the liberal arts education who does not callus his hands with manual labor. It is time we put theory into practice—and a good way to start is to give equal recognition to training acquired in college and that gained in business and theory."

Question: Are we in Lane County ready to practice this, that the dignity of work is such that we can offer voca-

tional teachers the same respect, consideration, and remuneration that we afford our regular academic teachers?

AN ADVANCED PLACEMENT PROGRAM

This next concerns the proposition that some sort of an "advanced placement" program can be designed in the vocational education program.

Past experience by students, colleges and high schools indicates that the advanced placement program, which allows the advancement of a student on an accelerated level, can be of value to students, can improve the quality of instruction, and has caused few problems.

With the cooperation of labor, industry and the school system, such an advanced placement program might be worked out for the vocational student—allowing him to work at an accelerated level.

High schools would, with the direct aid of labor union educational officers and industry, modify the existing high school programs to make them compatible with the union apprenticeship program and the needs of industry.

As an example—the senior year in electricity could be modified to parallel the first year of apprenticeship in the electrical trade. At the completion of the year's work, the student could request an examination. The Apprenticeship Council would prepare, give, score, and evaluate the exam and could then decide how much apprenticeship credit to give for the year of schooling.

The union could control the intake of apprentices by adjusting the cutting scores et al of the examination.

Many advantages would accrue from this approach:

1. Good public relations. Such a plan would bring industry and labor closer to the school.

2. Helping the student find his ability level. This would help decrease the number of drop-outs because the program could be more closely geared to the individual.

3. Helping students find employment. When the student takes his examination, a prospective employer might take special interest in him and help guide him through further education.

4. Establish a stable labor pool. With the closer cooperation of education, organized labor, and industry, a constant reservoir of trained people could be maintained.

5. Help in curriculum development. With the expert, interested help available from industry and labor, the technical-vocational school administration could be well advised on how to teach general and specific subjects.

CERTIFICATES OF COMPETENCY

One procedure that would add quality to the technical-vocational program of Lane County schools would be the use of a "Certificate of Competency."

These certificates would be awarded to students who, in the opinion of their instructors, based on objective test data and demonstrated performance skill in a specific area, are competent to enter the labor market with a minimum job entry skill.

This system would be of value to students and employers alike since it would be a reward to the student and advice to his prospective employer.

For instance, a student wishing a job in the business management field could take with him a certificate which would attest to not only his classroom study, but also his manners in meeting the public, his ability to work in a team situation, his good grooming practices, his reliability, good health and his ambition and initiative. In other words, his competency, his personality, and his abilities would be certificated by his school training instructor.

REGIONAL VOCATIONAL-TECHNICAL CONSULTANT

Continuity of subject matter and articulation of the various curricula among the many school districts and levels of education are major problems impeding the development of vocational-technical education. Employment opportunities do not follow school district boundary lines. Employment and preparation for employment are regional problems larger in scope than any one school district.

One of the often mentioned desires of teachers and administrators, especially of small and medium sized school districts, was the need for consultant help in the vocational-technical area.

There appears to be a need for a person, who is responsive to local needs, to spend full time in Lane County to aid schools in developing their technical-vocational programs.

If the recommendations of this study are to be implemented into an action program, some individual must give constant attention to the vocational needs of the entire Lane County region. It is the recommendation of this committee that the State Department of Education finance such a consultant service in cooperation with the Lane County Intermediate Education District and local school districts. Such a person, locally employed and readily available, could help districts propose and develop programs, secure funding for programs, and maintain liaison with labor, business and industry on a regional basis.

PHYSICAL FACILITIES

In the location of physical facilities for vocational-technical education there are three major considerations: (1) the educational quality provided, (2) the social implications of the facilities, and (3) the economic implications. Generally speaking, the latter factor, economic concern, has received the most attention from planners making decisions on facilities for vocational-technical education.

This has usually resulted in the development of a central vocational-technical facility to serve the needs of a district or geographical area. These facilities are now often known as area centers. An example is Benson Technical High School provided to furnish vocational-technical education for the students wishing this type of education from the entire Portland area. Another example is Minneapolis Vocational High School which for many years provided the vocational training for all the students of Minneapolis, Minnesota. Closer to home we have the example of the Lane Community College (formerly Eugene Technical-Vocational School) which is now the central facility for post-high school vocational-tecnical education in the Lane County area and beyond.

For many highly specialized occupational areas the community college must continue to serve as the central training facility. This is true not only for post-high school training but also for certain high school programs. It should be possible for a limited number of selected high school seniors to attend the community college on a part-time basis and begin training in certain highly specialized occupational programs. Some of the programs that might fit this pattern are: Data Processing and Computer Programming, Major Appliance Repair. Nursing, Auto-Diesel-Aircraft and Machine Shop Mechanics, Upholstery, Heavy Vehicle Maintenance and Operation.

Lane Community College is within thirty minutes driving time of 90 per cent of the secondary school population in Lane County and therefore can logically serve the highly specialized training needs of most Lane County high school

students. However, this will necessitate a high degree of coordination and curricular cooperation. It also will not relieve the secondary schools of their responsibility for occupational training.

The desirability of a central facility for vocational-technical education and the advantages thereto has been stated. But there is evidence that the central facility will not adequately serve the social or educational needs of high school students. Many students will not transfer to a separate vocational-technical facility and therefore will not benefit from the educational opportunity.

James B. Conant stated in his book, "The American High School Today," his conclusion that vocational programs should be offered in the comprehensive high school.

> "My inclination is strongly in favor of including vocational work in a comprehensive high school instead of provding it in a separate hgh school. My reasons are largely social rather than educational. I believe it is important for the future of American democrary to have as close a relationship as possible in high school between the future professional man, the future craftsman, the future manager of industry, the future labor leader, the future salesman, and the future engineer. As I have often stressed in my writings and earlier in this report, I am convinced that one of the fundamental doctrines of American society is equality of status in all forms of honest labor as well as equality of opportunity."

There is a recent trend across the nation which retains the benefits of the centralized area center and yet does not utilize this method of organization. Although not universally labeled, this alternative method has been often called sub-area centers. Courses which would not be utilized fully in a single high school in a geographic area are placed in only one, or more, if necessary, high schools in the geographical area. Students desiring this course can transfer their enrollment from their neighborhood school to the comprehensive school offering the particular curriculum in which they are interested. An example of this can be drawn from Minneapolis, Minnesota, where North High School has a complete culinary arts training facility. There are no plans to duplicate this facility in the broad geographic area of the District. Instead, students desiring this particular curriculum will transfer their enrollment to North High School. This sub-area center system is in full operation in Dade County, Florida where eight comprehensive high schools offer a wide selection of vocational curriculums and courses. (See Table 7)

Why should we consider the sub-area center method? It should be considered because of the implication of the third aspect of central facilities for vocational-technical education—the social aspect. The ramifications of the sub-area center approach from the instructional point of view must also be considered.

It is generally recognized by educators that a person going on to a four-year degree-granting institution, college must start to make choices and decisions concerning his education in junior high school. This necessity to choose an objective, although the choice is not irrevocable, applies also to those persons who would find satisfaction and service in the life of a skilled craftsman, technician, or other non-professional occupations. The student who will find his place in life through vocational or technical education must then choose to follow the educational preparation that will best suit him for this life. Presently there are many pressures within the school system, the community, from parents, and especially from the student peer groups for the student to appear at least to be planning to go on to a university education. Consequently, many students who through temperament, ability, and desire are not suited for the professional life of a university graduate are pressured into continuing the pretense of following a university preparatory curriculum. Such a curriculum may be very inadequate to prepare students for occupations that require types of training other than university.

If vocational-technical education is in large part offered in a central facility a student desiring this type of education must through his choice to attend this central facility openly display to all those who know him that he has forsaken educational preparation for university. Many students will not make this choice in spite of the fact that the student may recognize that he has neither the desire nor the temperament to accept a university education and that vocational-technical education would provide him with the type of life he would like. Consequently, many educators have found that it is nearly impossible to help

students to make a rational decision about choosing a vocational-technical curriculum which is offered in a separate institution with the sometimes unjustified, but attached label of non-college bound.

The alternative of putting vocational-technical curricula in certain high schools within the geographical area normally served by the central facility will to a large extent overcome the handicap of accepting a non-college bound label. A hypothetical example might be that if Thurston High School in Springfield offered electronics in a well equipped lab with a competent instructor along with their other curricula of the comprehensive high school, there would be less hesitancy on the part of a student who would normally attend Springfield High School to transfer his enrollment to Thurston High School. He still has available to him at Thurston High School all of the courses normally accepted as university prep courses and in addition he has available the particular vocational area he is interested in, electronics. The student transferring from Springfield High School to Thurston High School, to participate in the particular curriculum he is interested in, will still receive his diploma from a recognized comprehensive high school without the imagined stigma of a non-college bound school being attached to the diploma.

The advantages of the central facility, economy and competent instructors, are retained in this plan. It is the

Curriculum Bulletin 19A, 1965-66

recommendation of this committee that this placement of selective curricula in comprehensive schools be considered. In order to accomplish this it will be necessary to arrange inter-district transfer of students without an overwhelming financial burden on any of the districts or individuals involved. It is hoped that this could be coordinated through the Intermediate Education District and the State Department of Education.

COOPERATIVE WORK-EXPERIENCE PROGRAM

For many years prominent educators have recognized the educational value of work. Work provides youth an opportunity for growth which is not provided by any other part of the school curriculum. Although the need for youth to obtain work experience is today as great or greater than ever, many changes in our society have operated to reduce the opportunities. Through the cooperation of the home, the schools, business, and industry, work-experience education can be provided for our youth.

Every student should have the opportunity to develop good work habits and mature attitudes toward work. In earlier years, youth learned to work by performing the many necessary constructive tasks around the home. In today's industrial society, most adults work away from their home and children. There are fewer chores available around the home for young people to do. At the same time entry into full time employment has been delayed. Work-experience programs have been developed to cope with these changes. The feeling of worth one gains from performing on a real job and the opportunity to acquire good work habits are a necessary part of the training of every youth.

No school can successfully duplicate actual work conditions. Neither can business and industry slight its main goal of production for purposes of training learners. However, through enlightened self-interest the schools and community can cooperate to better serve goals of learning and production.

Cooperative work-experience education is a school directed program by which students obtain practical experience in producing useful goods and services. This experience is part of the regular school curriculum in addition to academic learning. The work situations may be in business, industry, the community at large, or in the school.

In a cooperative work-experience program, about two thirds of a student's time would be spent at school and one third on the job in the community. The student receives educational credit for his work experience, job related subjects, and general school subjects. Also the student is usually paid the going rate for any of his labor. Although the committee has no recommendation in this area there is a need for a new and creative approach to the pay angle for students while in training. It is not inconceivable that the employer should be paid for training the student rather than the student being paid.

The key to this community-school cooperation is the work-experience coordinator. He has a background of successful work-experience in the fields he is supervising. The coordinator is also a qualified teacher. About half of the coordinator's time is devoted to working with employers, students on the job, and parents. The rest of his time is spent at school teaching work-experience students job-related subjects.

The potential value of work-experience programs is great. The few work-experience programs that are now operating in Lane County schools, principally in distributive education and special education, are just a beginning. There is an excellent opportunity to expand vocational education programs through the addition of many more cooperative work-experience opportunities for students. The 1963 Vocational Education Act has greatly increased the financial assistance available for the expansion of cooperative work-experience programs in all fields. The Lane County Youth Study Project has recently received a grant from the U.S. Department of Labor to initiate a work-experience program with out-of-school alienated youths.

All youth can benefit from an opportunity to learn good attitudes and useful habits of work. This can best be done while skilled and understanding supervision is available. Guidance and supervision is an integral part of work-experience programs. Work experience will help youths who are aiming at vocations calling for college training to better see the relationship between their studies and their vocational choice. Research has shown that students who took vocational subjects in high school are not unduly handicapped when they go on to university. Those youths who are not going on to university need work experience that will better prepare them for choosing, securing, and advancing in an appropriate occupation.

The consensus is that all youths need to acquire self-discipline and good work habits. The desired objectives are more likely to be achieved when school districts follow the policy of granting credit toward graduation for work-experience received through participation in approved programs. Such action also supports the contention that credit should be given for learning wherever and whenever such learning may occur.

Some of the specific objectives of the work-experience programs are:

1. To provide youths an opportunity for a sense of worthwhile accomplishment.
2. To promote the attainment, by youth, of good attitudes and habits for work.
3. To provide an alternative or supplement for students who find the traditional curriculum inadequate.
4. To furnish exploratory experiences that provide the basis for vocational choices.
5. To promote a method for smoothing the transition from school to work.
6. To help some students with economic needs.
7. To motivate students by establishing connection between vocational life and school subjects.

Many communities have found that work-experience programs result in generally improved relations between school and community through processes listed below:

1. Increased confidence of the community in the ability of the schools to prepare youths for a useful life.
2. Teachers will be more aware of the work of the community, and thus be able to more closely relate their instruction to community life.
3. The social adjustment of youth will be aided by the development of desirable attitudes toward themselves, work, employers, and fellow workers.
4. Fewer youths will drop out of school because they will gain self-respect and self-confidence through work experience, as well as interest in school subjects relating to work experience.
5. Both the employer and the community will benefit from

having more satisfactory beginning employees and more efficient regular employees to serve the needs of society.

VOCATIONAL GUIDANCE

It is not within the scope of this report to thoroughly discuss the element of guidance in vocational education. However, a statement of facts and opinions on guidance ranges all the way from those who feel that it is a totally unnecessary frill to the opinion that it is the most essential ingredient involved in education and development of the individual. Guidance generally is recognized as an essential service for the optimum development of the individual in our society.

Not many years ago vocational guidance was an informal procedure. This is simply illustrated by the fact that many sons worked alongside their fathers for extended periods, thus becoming familiar with their father's occupation. Girls worked alongside their mothers preparing for the principal occupation of women. As the technological society changes at an increasingly rapid pace, fewer opportunities are available for youth to learn about occupations by working alongside their parents. Today many young people know little more about the occupations of their fathers or working mothers than what they frequently overhear as complaints about the work day of the parent.

A more formal system of guidance and exploration must now be substituted for the less formal but effective parental guidance of the years past. The educational system is the most logical portion of our society to provide the more formal guidance needed today. This is not intended to usurp the prerogatives of the parents, but simply to recognize the inability of many parents to furnish opportunity for effective occupational exploration in a rapidly changing occupational world. Their offspring are being prepared for occupations twenty years in the future. The rapidity of occupational change requires the services of vocational guidance specialists who devote all their efforts to an attempt to keep ahead of the changing vocational opportunities.

Vocational guidance is not just the imparting of occupational information to human computers who will then automatically evolve the right answer. Rather, vocational guidance consists more of a developmental function. It is a process which must be started at an early age and is always a process and never an end. Some key factors are the providing of exploratory experiences for students when they indicate an interest in such things. A development of attitudes for work, earning a living, being of service to others, the components of a satisfying life, etc., are key factors of vocational guidance which presently receive too little systematic and continuous attention.

Unless proper guidance provides students with the basis for intelligent selection of their educational opportunities and occupational choices, other vocational education provisions will be poorly utilized. There are several concepts which should be given consideration: (1) the concept that educational development must come before vocational development; (2) the concept that working with the hands and wearing a blue collar denotes low status; (3) the lack of occupational knowledge and experience of the majority of elementary and even secondary teachers; (4) the concept that college is for the successful and vocational education is for the unsuccessful; (5) the relationship of a person's occupation to his way of life; (6) the methodology of helping young people develop sound occupational choices; (7) the point of view or lack of it concerning occupational choice help by guidance personnel.

It is the recommendation of this committee that every school district analyze the adequacy of the local vocational guidance program. Some discussion must take place among all teachers, grades one through twelve, about their own attitudes toward vocational-technical education.

DEVELOP TECHNICAL-VOCATIONAL RESOURCE CENTERS

The development of Resource Centers for Technical-Vocational Education is essential. Adequate inventories of instructional materials and sources of technical-vocational information are conspicuous because of their absence in most public schools in Lane County.

The shortage of library materials, trade journals, periodicals, current technical bulletins and manuals is one of the major problems facing teachers and administrators in development of quality courses in technical vocational subjects.

The study group recommends that:

Administrators and librarians dedicate thought and effort in building well-stocked resource centers and libraries for Technical-Vocational Education.

These centers should include:

a) Copies of Federal, State and local building and construction codes.
b) Trade journals and periodicals for the areas of Construction, Electronics, Distribution, Manufacturing and Processing, Service Industries and Agriculture.
c) Selected copies of Department of Defense training materials.
d) Free and inexpensive career and occupational information such as New York Life Insurance Company's Occupational pamphlets.
e) Technical bulletins and manuals available from most major producers and manufacturers.
f) Current copies of Commercial Reference Manuals published for the various trades and occupations, such as "Chilton's Auto Repair Manual" etc.
g) Professional texts and references from educational publishers and associations in the field of Technical-Vocational information.
h) Copies of courses of study in Technical-Vocational subjects from Universities, Colleges and

Public School Districts should be obtained and made available to professional staff working in the area of curriculum development.

i) Current vertical file materials in the area of "Vocational Guidance" should be available in each library and resource center.

j) Current copies of Bureau of Public Documents U.S. Printing Office's catalogue of manuals and pamphlets.

COORDINATE APPRENTICESHIP PROGRAMS WITH SECONDARY SCHOOLS AND COMMUNITY COLLEGE CURRICULA

It must be pointed out that business, labor, industry and education in the Lane County region have enjoyed a most friendly and cooperative relationship. As a result, the apprenticeship programs in Lane County have also been operating in a harmonious manner with the schools.

However, just as there is little relation between the secondary and community college curricula, the apprenticeship program is usually unrelated in any direct way to the individual's prior education at the secondary school and community college level.

The entire field of apprenticeship in Oregon has been discussed and studied well beyond the scope of this study. The 1965 legislative session spent many hours in hearings and in debate on developing new patterns for the apprenticeship program.

This study committee wishes to mention only in a brief way those observations that have not been covered by other reports.

(1) Much work must be done in convincing employers to take apprentices into their businesses. As one apprenticeship field worker has said, "You give us the employers and we'll give you the apprentices."

(2) Pre-apprenticeship programs must be coordinated more closely with apprenticeship as it actually operates from day to day. Too few students graduating from community college pre-apprenticeship programs are actually entering apprenticeship training. Counseling and follow-up is vital to not only entry but continuance in the program.

(3) Instructional materials for the classroom work of the apprentice training program must be constantly up-dated. The State Department of Education might investigate this need with an eye toward systematically providing fresh instructional materials.

WELL DEFINED POLICY IS NEEDED FOR PUBLICLY SUPPORTED OCCUPATIONAL EDUCATION

The development of a comprehensive policy defining the nature and extent of public responsibility for occupational education is needed. This study has revealed the need for multi-agency decisions on:

(1) Establishing occupational education programs related to regional and statewide job opportunities.

(2) Developing guidelines for determining those experiences needed in the classroom, and those more economically and efficiently obtained in on-the-job training

(3) More clearly defining the role of different public agencies in providing occupational education.

(4) Boundary lines between public and private responsibility for occupational education.

CHAPTER IV — A PICTURE OF LANE COUNTY SECONDARY SCHOOLS AND METHODOLOGY OF THIS STUDY

High Schools in Lane County range in size from the smallest, with an enrollment of 59 students, to the largest, with about 1,800 students.

With this range in size and scope of offering, it was difficult to approach the problem of what is currently being taught in the area of technical and vocational education.

The survey sought answers to two broad questions: What do we have to work with, and how effective a job are we doing?

The study was divided into two phases—an inventory and an evaluation.

Alternate approaches were offered each school. The principal could meet with his staff and fill out the forms; or a member of the study committee could go to each staff member and complete the form, returning it to the principal for his inspection; or a member of the study committee could attend a prearranged meeting of the staff and principal to discuss the forms and the proper method of filling them out.

The third alternative was the most desirable in most cases.

A modification of the National Secondary School Evaluative Criteria was used in the areas of agriculture, arts and crafts, business education, distributive education, industrial arts, technical-vocational subjects, home economics and guidance.

The original intent was to form evaluation teams of teachers to visit each of the county's 41 secondary schools. But time ran out and this was not done. In most cases, each school principal was given the choice of what method of evaluation was most acceptable to him. This amounted in most cases to self-evaluation.

Results of the tabulation and statistical analysis of these evaluations appear in the appendix of this report.

These are the patterns apparent to the study group:

CURRICULA

1. **Trade and Industry.** Several patterns were revealed here. Few high schools in the county are offering courses in the Trades and Industry area at the present time but most of the schools indicate desire to expand these courses. They were in the process of planning and deciding what courses they should offer and what would be needed to do it. Small and medium size high schools indicated they would have major problems in developing any quantity of trade and industrial curricula. Even in the larger high schools the problem appears to be one of direction. Which program is needed and which program can be developed?

2. **Commercial Education.** Nearly all schools expressed a desire, and had plans, to develop commercial courses or expand what is now being offered. Most want to expand secretarial courses, especially at the senior level. Even the smaller schools feel this is an area of technical-vocational education that would fit their facilities and curriculum.

This is also one area in which almost all schools had sufficient equipment, facilities, and staff to present a comprehensive program. But there is a pressing need for more information: Most of the schools are dependent upon commercial equipment salesmen to bring them up to date on new materials, techniques and job opportunities. How to teach these courses and how to keep the curricular offerings up to date and in tune with the times is the big problem here.

3. **Distributive Education.** Here is an area begging for expansion. There seems to be a real and pressing need for more consultant services and curriculum construction help. Administrators and teachers agree there is a need for training students in this field, and studies indicate a demand in the local labor market for persons trained in the distributive skills. The problem seems to be in finding

teachers and consultants trained in merchandising, salesmanship, and other phases of instruction. Local administrators, while willing, need more help in setting up functioning programs.

4. **Vocational Homemaking.** Training in the domestic service occupations is a new and unexplored educational area in our county schools. Again there is interest, but a strong lack of information on how to develop courses. Also, there appears to be a shortage of teachers trained in this area. The major emphasis in homemaking appears to be on meeting personal and family living needs. Student interest and enrollment also appear to be a problem.

5. **Graphic Arts.** No real course in graphic arts is being offered in any of the Lane County schools. Most of the courses in related areas, such as arts and crafts and photography, are not being presented as vocational, but

rather as cultural or avocational. Several schools expressed interest in development of Design and Commercial Art courses, but feel inhibited by lack of consultant service as well as a shortage of qualified teachers.

6. **Agriculture.** Four secondary schools in Lane County are offering vocational agriculture courses but enrollment is on the decline. However, there is a demand for young workers in jobs related to agriculture. Teachers and administrators feel that this is an area undergoing revision at the present time. Oregon State University is currently conducting a program aimed at revision of the vocational agriculture programs at the secondary school level. The "new program" appears hopefully to offer students opportunities to develop skills in sales and service of equipment; horticulture; landscaping; forestry; timber harvesting, as well as agricultural production.

COMMENTS FROM TEACHERS AND ADMINISTRATORS

Here are some of the comments given the study committee by Lane County teachers and administrators:

1. Consultant services are needed in the areas of commercial education, distributive education, graphic arts, trade and industry, and domestic service.

2. A professional library with the newest vocational-technical professional books, catalogs and study courses should be readily available to all administrators and teachers.

3. There should be a standard "scope and sequence" to serve as a guide for all people working in the area of curriculum development in these fields. There is a need for definition, for some standardization, what sequence should be offered. For example, teachers feel that a course called Typing I should be basically the same wherever it is taught. Another example brought up is in the field of Home Economics. These courses, while they vary but little, are called many things and it is difficult for inter-school communication when so many titles are used.

4. Perhaps "minimum lists" of equipment and supplies needed in specific courses should be developed centrally to aid administrators and teachers in planning new programs or expanding and modernizing old ones.

5. One respondent said, "there is a real need for our teachers, administrators and consultants to agree on a common vocabulary and stop the "battle of semantics." What is a prevocational course or a vocational course? What is an industrial arts course? What is general education?

6. There was a need expressed by several teachers and administrators during the survey for the Lane County Board of Education to establish a new position within the Intermediate Education District: This position could be called Consultant in Technical and Vocational Education. He would act as an advisor or consultant to teachers and administrators in this rapidly expanding area of vocational education. He could also help coordinate funding efforts in this geographic region.

7. Many expressed a desire for an investigation into sharing facilities and staff and exchanging students. In essence, this would be the establishment of sub-area centers for certain courses, and an area center for others. This need was especially voiced in the field of trade and industry courses. Large tuition payments appear to be a major deterrent in the free exchange of students.

8. More guidelines are thought to be needed in the general area of vocational-technical education. Not enough educators know what to do, when to do it, and how. The regional nature of employment opportunities make this a problem of more than one school district.

9. Closer relations should be established with employers, the potential consumers of our products.

This one comment reflected the feelings felt by others:

> "We know that sixty-five percent of our students are terminal and need to be given either a minimum job entry skill or incentive to continue in a technical or vocational program, yet we continue to devote the major part of effort and money in promoting the college preparatory program . . . Why can't we get our heads out of the sand?"

The results of the entire survey have been tabulated and appear in the appendix.

METHODOLOGY OF THE STUDY

Inventory and Survey forms were constructed, rejected and reconstructed, and it was finally decided that it was impossible to construct an instrument that would do a really effective job in analyzing the curricula, equipment and facilities in all the schools in Lane County due to the range in size and course offerings. The final instrument was labeled the "Muu Muu"; it would fit each situation but was not really tailored to any. This form was distributed to each school and procedures for filling out the form explained to the principals. These forms were tabulated and the results were produced in table form. Several interesting patterns emerged in this phase of the survey. One pattern that became apparent was schools are not really poorly equipped, in small hand and power tools. The needs seem to be in the area of a variety of large mounted power tools in adequate numbers so that a unit in operation and care of power driven tools can be effectively presented. Space for adequate numbers of larger power tools seems to dictate the number available, more than the availability of funds to purchase the tools.

GENERALIZATIONS

Several generalizations could be made from the Inventory Phase of the Survey:

1. Consultants are needed to work with administrators and teachers in the areas of Commercial Education, Distributive Education, Art, Trade and Industry and Homemaking.
2. A professional library containing newest professional books, catalogs and copies of vocational-technical courses of study should be made available to all administrators and teachers.
3. A standard "Scope and Sequence" should be available to all people working in the area of curriculum

TABLE 10

STATEWIDE ENROLLMENT DATA—A MEASURE OF HOLDING POWER

Enrollment figures for the last 13 public high school graduation classes (1952 through 1964) in Oregon, are shown by grade levels. Each year's figures do not include transfers within the state. Transfers into the state are included with the assumption that these approximately equal transfers leaving the state.

Data for the following table were obtained from attendance records in the State Department of Education. The percentage figures in parentheses in each instance indicate the cumulative survival from the ninth grade.

Class of	Ninth	% Lost	Tenth	% Lost	Eleventh	% Lost	Twelfth	% Lost	Graduated
1952	18,918 (100%)	7.7	17,457 (92.3%)	9.4	15,687 (82.9%)	12.4	13,331 (70.5%)	6.7	12,071 (63.8%)
1953	18,971 (100%)	6.0	17,834 (94.0%)	10.2	15,894 (83.8%)	11.8	13,659 (72.0%)	6.0	12,526 (66.0%)
1954	19,994 (100%)	6.8	18,627 (93.2%)	10.4	16,559 (82.8%)	9.8	14,603 (73.0%)	6.7	13,266 (66.4%)

1958	23,226 (100%)	4.1	22,278 (95.9%)	7.3	20,577 (88.6%)	9.6	18,358 (79.0%)	7.8	16,645 (71.2%)
1959	23,923 (100%)	3.9	22,989 (96.1%)	7.4	21,209 (88.7%)	8.7	19,125 (79.9%)	8.2	17,144 (71.7%)
1960	26,696 (100%)	4.0	25,627 (96.0%)	5.7	24,124 (90.3%)	9.3	21,734 (81.0%)	7.8	19,560 (73.2%)
1961	27,969 (100%)	3.1	27,104 (96.9%)	5.2	25,637 (91.7%)	8.1	23,376 (83.6%)	7.6	21,261 (76.0%)
1962	26,762 (100%)	2.5	26,089 (97.5%)	5.3	24,668 (92.2%)	7.5	22,680 (84.7%)	7.2	20,750 (77.5%)
1963	26,603 (100%)	2.1	26,037 (97.9%)	4.5	24,847 (93.4%)	6.8	23,031 (86.6%)	8.4	20,800 (78.2%)
1964	30,264 (100%)	1.9	29,701 (98.1%)	3.3	28,692 (94.8%)	5.6	26,998 (89.2%)	8.4	24,463 (80.8%)

These enrollment figures show that 80.8% of the ninth graders survived through graduation for the 1964 class compared to 63.8% for the 1952 class. The drop-out rate has progressively decreased between grade levels for each of the 13 years shown, but there has been some increase in loss after entering the 12th grade. This means that those who do drop out are staying in school longer.

Source—Lane County Board of Education

development for commercial and industrial courses. A need for definition of what content, in what progressive sequence constitutes a course is apparent when one looks over the courses and talks to teachers and administrators. There is no desire to establish a lock-step type curriculum; however, both administrators and teachers alike expressed the thought that it would be desirable to know that the content and structure of courses would be basically the same in various schools. An example mentioned by many school people was the variety of course names and content in the Home Economics area. Some schools in the same district have different course titles and slight variation in introductory Home Economics courses, i.e., Home Economics I in one school, Homemaking I in another—Senior Homemaking in one school, Advanced Home Economics in another, etc.

4. Perhaps "minimum lists" of equipment and supplies needed in specific courses could be developed to aid administrators and teachers in planning expansions of the vocational-technical program.
5. There is a real need for teachers, administrators, and consultants to agree on a common vocabulary. What

is a prevocational course? What is an avocational course? What is an Industrial Arts course? What is general education?

6. There is some thought that possibly the Lane County Board of Education through the Intermediate Education District could establish a position: Consultant in Vocational and Technical Education, to act as an advisor or consultant to teachers and administrators in Lane County in the rapidly expanding area of Vocational Education.
7. There was an expressed desire to investigate in detail the possibility of "sharing" facilities and staff and equipment in some areas, and "trading" students. In essence, establish Sub-Area Centers in certain areas of the curriculum and development of an Area Center for other areas particularly in the "Trade and Industry" type courses.

EVALUATION

The results of the evaluation phase of the study were tabulated and placed on charts. The results seemed to indicate most schools were doing an average job in teaching the courses offered, the quality of the staff was generally very good, the courses of study seemed to be more than adequate, materials were in ample supply and usable, equipment was a problem in some schools, but on the whole it was generally adequate. Facilities, opportunity for expansion, and articulation seemed to be the greatest problems.

Most schools in Lane County are doing a creditable job, however, almost all schools indicate they feel there is real need for:

1. Improvement of Vocational Guidance services.
2. Curriculum revision of all courses and development of a related vocational or terminal program in the academic as well as the vocational laboratory offerings.
3. Need for strong leadership in the vocational-technical field and establishment of stable, dependable guidelines.
4. Closer relations with the employers and firms hiring the products of the secondary schools.
5. Agreement between Industrial Arts people and Vocational people to put aside differences and opinions and cooperate in the establishment of a sound educational program for the vocationally oriented student.
6. More realistic viewpoints on the part of the public, school boards and administrators regarding the needs of students.
7. Secondary schools must make greater efforts to remedy educational weaknesses. It is not sufficient to blame the elementary schools when students come to high school unable to read or compute. High schools must intensify their efforts to provide remedial education. Programmed learning may hold some hope for the future in dealing with these problems.

Note: All statistical information from the survey may be found in Appendix B at the conclusion of this study.

CHAPTER V — SOME NEW PRACTICES IN VOCATIONAL-TECHNICAL EDUCATION

Today, the role of the high school in preparing students for employment is getting more and more attention by educators everywhere.

The American Association of School Administrators, in a convention at Atlantic City in February, 1965, passed a resolution urging all administrators to strive for more effective technical-vocational programs.

The need for adequate vocational preparation in secondary, as well as post-secondary schools, is well documented in a study by Harold T. Smith of the W. E. Upjohn Institute for Employment Research at Kalamazoo, Michigan.

Smith's research includes a report of developments in other states besides Michigan and points out that "in order to provide the right kind of vocational programs for the two-thirds of our youth who now enter the world of work with no skill, and in order to help carry the increased load of adult education that now exists and that lies ahead, our facilities for offering secondary as well as post-secondary vocational education must be greatly expanded."

Since this is a new effort on the part of public education, various patterns have emerged. But in general, it is accepted that the junior high school should provide courses of an exploratory nature. The student is allowed to explore various fields, all the while guided and counseled so that his interests are found. This phase may continue into the 10th grade—the first year of high school.

Considerable flexibility must be allowed at this level. The student who may have embarked on a course of college preparation may find, after exploration, that a vocational training program is more to his liking and more to his aptitude. Some students may elect to go into an occupational exploratory program at a later period in high school.

In some cases, of course, a combination of occupational exploration and college preparation can be planned for a more comprehensive education. Smith points out that "it is generally misleading to call one course college prep and another business or vocational when the evidence is clear that many high school graduates who have followed a business course of study or a vocational course of study are admitted each year to the college of their choice and make good records in higher education."

It goes almost without saying that the reverse is true: Many students who follow a college prep course through secondary school do not go on to college but rather find themselves a vocation after high school graduation.

Assisting the high school student in "finding himself" is not an easy role for educators, yet research indicates that much more can be done, not only in this exploration, but in actual vocational training so that by the time he graduates from high school the student not only has a good idea of what he wants to do but also that he knows how to do it.

A SUGGESTION FOR OREGON

A plan for vocational training in the high school and post-high school area seems to be emerging and is becoming more and more generally accepted throughout the country. The Oregon State Department of Education has provided much leadership in developing this approach to vocational education. Table 12 gives an example of the scope and general sequence.

It is readily seen that the program provides for the necessary exploration at the higher elementary grades, junior high and early high school. The courses include such as Industrial Arts, General Shop, General Business, General Foundation Agriculture courses and Beginning Homemaking courses.

During this exploratory phase, the guidance personnel and teachers (in both vocational and general education) should be able to help the student plan for the 10th, 11th, and 12th grades and for his future, either employment or further education.

Consideration should also be given to the success of the student in his other courses such as English, mathematics, and science. Occupational areas in which math and science are essential, such as engineering-technician field, should be determined largely by the student's accomplishment in these areas.

In the 9th or 10th grade, the student could select a pre-vocational or pre-technical program in a broad "cluster." An example of this would be the electrical-electronic field, woodworking, metals or graphics.

Then, as he goes into the 11th and 12th grades, the student would specialize more. From the general metals area he could progress into machine shop, or from power mechanics into the specifics of drafting in the architectural field, from electrical-electronic he could move to the electronic area in the pre-technical or pre-engineering area.

The student who is in the pre-technical field could narrow his pursuit down to a specific job area in the last year of high school or in community college, so that when his education terminates he would have had the broad experience of several classes in the cluster and finally, the one specialty he has sought as he found out more about the field.

Job entry would come at the termination of high school for some, at the termination of community college for others. The important thing is that he would be prepared —he would know more about himself and his skills. And, meanwhile, he would have been given a general education for citizenship and a better life.

In an Industrial Arts curriculum guide developed by a committee of Industrial Art teachers and the Oregon Department of Education in 1964, exploration is suggested for junior high school, specialization in high school.

Again, the plan allows the student to find his interests in junior high school and his level of ability in the higher grades. High school would either prepare him for a job or encourage him to seek higher education.

THE CALIFORNIA INDUSTRIAL SYSTEM PROGRAM

California has developed a "three track" system in industrial education. Table 13 gives a graphic illustration.

This program provides for general exploration in industrial arts in the junior high school. From interests developed at this level, selection and guidance would put the student on one of three tracks in high school. The selection of which track would be made according to aptitude shown in industrial art courses and also in the related courses such as mathematics, physical sciences, general sciences, and English.

A student who has shown considerable aptitude in science and mathematics might be encouraged to follow the track of the technical-occupational system.

TABLE 12

AN EMERGING CONCEPT
OF THE
ROLE OF VOCATIONAL EDUCATION IN OCCUPATIONAL PREPARATION

The student who is not quite as interested in the abstract sciences and theory would be guided along the track toward trade and industrial occupation.

The student who is university-oriented and has shown interest in the industrial arts field might follow the track of industrial arts general education. This could lead him into teaching or might serve as a general background for a professional industrial field where he needs a basic understanding.

TRACK I

As the chart shows, the technical education track might lead into a junior college engineering-technician program and then job entry. Or the student may elect to take further college education.

TRACK II

He who followed the industrial arts education path would take additional industrial arts of a broad nature in high school and go on into junior college industrial arts work and follow this with a professional education and a baccalaureate degree. He could enter a professional field or seek further education and teach.

TRACK III

The third track is the trade and industrial occupational system. This would give preparation to a person going into a job after high school. This could be an apprenticeship, or a job requiring no further training. Courses offered would be machine shop, drafting, et al, which would equip the student for a job upon graduation. But this person could also elect to pursue his craft at the junior college, taking advanced courses in drafting, carpentry, cabinetmaking and the like.

This track system employed by the California school system is adaptable for agriculture, homemaking, business education, distribution and others. It provides for finding levels of attainment in any of the occupational preparatory fields and has the advantage of routing a student according to interest and ability. It is systematic yet allows flexibility.

CLUSTERING OCCUPATIONS TO DETERMINE TEACHING AREAS

Clustering jobs, that is, collecting them into groups, is an aid to working up vocational and technical educational curricula. Similar jobs are clustered so that courses can inter-relate and have meaning one to the other.

Again, as we suggest "exploratory" courses in junior high school, we have suggested broad cluster-programs at the lower level and the pyramid would narrow in the higher grades.

The general occupation clusters seem to fall into the following categories:

1. Business Management. Includes managerial, secretarial, office jobs.

2. Technical-mechanical. Includes engineering and highly-skilled technical and mechanical jobs that require considerable skill and technical background.

3. Production. Includes pre-vocational study in agriculture and agriculture service; timber or lumber production; metal fabrication and repair; construction, including carpentry and cabinetmaking; and food processing.

4. Distribution. Includes the several occupations such as sales work, stock control, warehousing and transportation.

5. Service. Includes jobs in health, social service, food service, protective, domestic and custodial work.

These are broad occupational clusters. From them would evolve more closely-related clusters in which there is a cross-pattern of skills and knowledge.

ANALYZING CLUSTERS FOR CURRICULUM CONTENT

Considerable study must be made of the work skills and related general education before an analysis can be made of the occupational cluster. This should be done by a committee of persons employed in the occupations, by educators and by other experts acquainted with the placement routine for employment. Such studies should be made on a statewide basis so that the general courses would apply to many schools within the state.

There should also be consideration of the requirements of pre-vocational training essential to standardization between the several states. Our population today is mobile, our people are migratory. A person trained in Lane County should be equipped to accept employment in other parts of the country or in foreign fields. Exceptions to this—such as specialization in timber and lumber fields—will be few.

Attention must also be paid to the general education courses such as English, mathematics, sciences, etc., so that they have relationship to the student's functioning in the occupational cluster. Reorganization of these general fields is essential to make them more useful within the concept of technical and vocational training.

This study project staff and advisors have been constantly reminded that the old way of teaching vocational skills is often no longer appropriate. There is much interrelationship between vocations—hence, the cluster for today. Isolation of a single course is not practical.

"Already, we are seeing close coordination of such vocational instruction as agriculture and distributive education, trade and industrial education," according to John P. Walsh and William Selder in "Vocational Education in the Secondary School," published in the 64th Yearbook of the National Society for the Study of Education.

OCCUPATIONAL EXPLORATORY COURSES

As the more general areas are offered as a means of exploration for the student in the junior high school, and sometimes 10th grade, there is paramount a need for a team approach between the guidance counselor and the English department head, between the guidance counselor and the head of the mathematics department and so on.

In many cases, the general courses will need to be "bent" a little, so that they fit into the occupational training.

In the past, we have failed too many times to help the youth in his preparation for vocational training. We have by the selection and placement system eliminated many

TABLE 13

Industrial Education System Programming

California State Department of Education
Bureau of Industrial Education

who needed education of a vocational nature. Now we can approach the problem from a new direction—allowing the student to first explore and then find himself.

"Education in general has failed to help the disadvantaged youth, and vocational education has largely eliminated the group by imposing selection devices," Walsh and Selden stated.

It should be said here that flexibility is a desire. It should be possible to give direction to a student so that he may plan his senior high program for an occupation cluster, but without narrowing preparation to a specific job or occupation level.

Considerable counseling of parents may be necessary. Often, a student's motivation and achievement alters when he enters senior high school. And parents insist, generally, on so-called college prep courses.

A very important and difficult part of guiding the child is counseling with his parents. The prestige of going to college is so great in our society that almost all parents want their children to go to college.

A new definition of college is needed. With the increasing demand for post high school education the meaning of the word college has changed dramatically. A resolution from the 1963 AFL-CIO Convention stated:

> "The time has come when education beyond the 12th grade should be the right of every young person. More than a century has passed since 12 years was set as the standard for free public education. Since that time, there has been a vast multiplication of knowledge and a greatly increased demand for higher levels of education. The 12th grade can no longer be accepted as the standard for a completed education. Free public education should be extended at least through the 14th year."

However, a note of caution is sounded by many of the experts in this field: Rigidity is to be avoided wherever possible. Change must be allowed. A person who has shown considerable interest in a vocational-technical school at the junior high school level may show high proficiency in the academic pursuits once he is in high school. Encouragement must be given him to change over to a university preparatory course or to pursue some other education within the vocational cluster. Changes in career course planning must be made possible when the facts justify such action. His years of exploration will not have been wasted, for even after college he may find himself happier and better suited to the occupation he found out about in the earlier years.

Selection of students to go into specialty fields—the narrower job cluster—with the high school course terminal, must be made on the basis of the person's maturity as well as his aptitude. Will he be sufficiently mature, upon graduation from high school, to take on the job once he is trained for it?

Generally speaking, only a large high school or an area center is able to provide a full line of vocational-technical programs, but the smaller school can do much to provide the guidance, the push, for the student to seek his education in some other way.

In the school able to afford it, such courses as auto body repair, auto mechanics, carpentry, machine shop, mill work, and cabinet making would equip the student for employment. In this case, he should be able to attend the vocational part of his course for several consecutive hours, or half a day, so that intensified, blocked out training is given.

There is evidence today that the time-honored apprenticeship program is less than satisfactory and that some kind of combination apprentice-classroom education will have to serve the needs of industry.

"It is apparent that apprenticeship is not meeting and will not meet the manpower needs of the nation nor the needs of the youth. The system at its best is slow and inefficient; and as it is now in operation, it is probably more a barrier than a bridge between youth and jobs," Norman C. Harris stated in "Redoubled Efforts and Dimly Seen Goals," printed in Phi Delta Kappan, April, 1965.

Considerable attention must be paid in the future to technical training, i.e., electrical-electronic-chemical technology, air conditioning and so on. This is a nearly completely overlooked field of education today, perhaps due to lack of teachers and administrators who can handle the problem.

"When equipment and controls are primarily mechanical, it takes about 10 per cent of the job time to find the trouble and 90 per cent to fix it; when electronics and hydraulics are involved, the percentages are reversed," Robert Auther pointed out in the American Vocational Journal, April, 1965.

For the student aiming at a technical field, a good aptitude test is essential to find his level in algebra, basic science and his ability to absorb abstract material.

In an article entitled "Vocational Education in the Curriculum of the Common School," in the 64th Yearbook for the National Society for the Study of Education, the author said:

> "Studies are revealing that more, not fewer, technological skills demanded by modern industry can be handled by high school youth; their capacities for training in skills have perhaps been as under-exploited as those for traditional academic training."

There is a large chance for coordination among the technical courses and the vocational course. A student studying auto mechanics, body and fender work, etc., should learn to weld. Also, a technical course such as machine shop process should be of importance to the auto mechanic or the farm mechanic.

As in the case of pure vocational training, the student studying a technology must be offered the right kind of academic courses. The mathematics and the science he studies should be shaped to help him in his technical pursuit. To develop courses of this nature would mean some duplication of general education courses, as there would be some courses for those planning the professional and college degree program and those who are planning a technical or vocational competency program. To develop such general education courses, it would be advisable to approach this on an area wide basis.

In the smaller high school, such development would depend on the instructor of the math and science course and the instructor in the technical or vocational course. To these would fall the responsibility of making the general course applicable to the student's pursuit.

A well planned vocational program integrates vocational education and general education. The vocational education should be built on a sound base of general education.

As one considers that the high school graduate of today will change jobs four or five times in his lifetime, the value of general education in the vocational training becomes apparent. While the student is to be taught a job skill, so he may find a job, still he must be given a broad enough base so that he can adapt to changing circumstances. For instance, the communication skills should not be overlooked.

Also, as technology changes, the manipulative skills become less important. Merely being able to do something with one's hands is not going to be able to serve him well in the future. The plumber has learned to use plastic pipes instead of metal pipes, but he continues to need to communicate, to read instructions, to use arithmetic.

The general education courses cannot be neglected. They can, however, be reshaped to the needs of the student who will benefit from pursuing technical and vocational subjects. Reading, for instance, must never be devalued—for in the fluid situation a worker finds himself today, it demands that he read in order to constantly improve himself. The technician must read technical journals to keep abreast of developments, others must read the many offerings from outside their own spheres so that they can know of opportunities.

PROVIDING FACILITIES FOR PREVOCATIONAL AND VOCATIONAL TRAINING

Finding the space, the place to teach these courses, we have mentioned, is a large problem, something of the magnitude of finding people to teach them.

In many of the vocational-technical areas it is hard for the traditional high school to provide the equipment and the facilities, plus the instruction and sharing program.

In these cases, many times, a sharing program could be worked out. One school would contract with another school for the use of services and facilities, and the other school would reciprocate in some other field.

If the sharing program is the answer, a master plan for all high schools in the area is a must. This could be county-wide or cover a smaller or larger geographic area. The savings of such cooperation and coordination are readily seen. The provisions could be made for many different types of programs with a minimum of duplication.

The large problem of organizing this type of program would be one of "selling" the various school boards to make the necessary financial outlay for facilities and equipment on the basis of reimbursement from the other districts who use them. And scheduling becomes a complex operation.

PROGRESSIVE CURRICULUM AT SEVERAL SCHOOLS

Another plan for providing the facilities, equipment and instruction in some of the more involved vocational programs would be to offer the broad preparatory courses at the comprehensive high school, and to plan the specialized, extensive 12th grade courses at the larger high schools, area center, or community college.

This would be a combination of the sharing plan with a coordinated curriculum pattern for all high schools in the county.

AREA CENTER

An area center school for vocational and technical training would serve all high school students within a reasonable commuting distance and could offer superior training.

Such a facility would provide one half day of vocational courses with the other half day of general education classes being provided in the home school. Some of this programming was accomplished between the Eugene area high schools and the Eugene Technical-Vocational School.

The area center could also provide the general education courses, thus eliminating the need for transportation between the two schools.

An example: the Sussex Vocational Technical School in Sussex County, Delaware.

This institution is similar to the former Eugene Technical-Vocational School. It could be copied here: either by the use of one countywide area center or by regional centers such as in the Oakridge area, the Eugene-Springfield area, the Florence area and the Cottage Grove area. If taken on the regional basis, with several in the county, the student could attend his own high school for his general education and attend the regional center for his or her vocational-technical course and lab work.

Because the center would draw from a larger tax base, and serve more students, it could afford the expensive machinery, the larger classrooms, the specialized structure that the ordinary high school could not.

The building itself would provide for departments, shops, laboratories and related classrooms. For instance, in areas such as chemical technology, metallurgy technology, and other such courses, labs of the type to be found in engineering schools, and not in the conventional high school, would be furnished.

Not only in Sussex County, Delaware, is this found, but another good example is the Allegheny County Area Technical School at Pittsburgh. Here, the school has provided a two year course for high school juniors and seniors in electronics, chemical technology, marketing technology, data processing, computer programing, instrumentation, civil construction and others.

Other areas have tested these types of programs and found them satisfactory, both from the standpoint of cost

and the quality of education. Bus transportation is furnished in the situation where the area center is used by the student for only half a school day.

The major disadvantage of providing the total program at an area education center is one of social consequence. The student becomes segregated from his friends that he has known throughout his school experience. This separation tends to place the vocational student in a separate classification; he loses the social value of working and moving with students he has known and the system tends to stratify society.

But the advantages of an area center are great. Not only can expensive courses be offered at an economical saving, but the center can also be used as an adult, after-hours, training center. It can also be used for some of the exploratory courses for the younger student.

The large area center can bring in specialists as instructors—the larger number of students make it economically feasible to hire experts, paying them a wage commensurate with what they could get in outside industry.

Using the large area center, it would be easier to fit courses into sequence with the community college courses and these courses could be tailored to meet the specific demands of industry.

Area wide advisory committees could be formed for specific clusters, thus community support would be built in. It would be difficult to draw up an advisory committee, for instance, in agriculture chemistry unless the center was large and centrally located. On the other hand, it is unlikely that the traditional high school, or even a smaller regional center, could offer such a specialized course.

Guidance, counseling, and placement would be more effective at an area training center. It is often a problem for the smaller high schools to obtain counselors who are versed in the technical and vocational fields. And, too, the demand in the comprehensive high school is for college-bound counseling and the vocationally-oriented youth is often slighted.

A placement service can be furnished at an area center. A person, or persons, can be given the tasks of finding jobs. Because he is connected with an area center, he is in contact with the industry that wants his graduates.

OCCUPATIONAL CHOICES CHANGE

Another factor that must be taken into consideration is the transitory nature of the secondary school student's occupational desires. Specific high school occupational training programs tend to force students into early career choices which they are not usually adequately prepared to make. This leads many students into frustration, failure, and waste of time.

Project Talent, a research project sponsored by the University of Pittsburgh School of Education, recently summarized what had happened to high school juniors of 1960 two years later (a year after they had been scheduled to graduate from high school). They found that only 27 percent of the high school junior year career choices of boys remained unchanged.

One of Project Talent's major goals is development of a comprehensive counseling guide which will indicate certain patterns of aptitude and ability on the basis of which predictions can be made of success in various careers. Studies years hence will be necessary before that can be developed in comprehensive fashion, but Project Talent researchers discovered from the material in this study that the patterns for certain occupation (electricians, carpenters, machinists, mechanics, sales clerks, clerical workers, draftsmen, military servicemen, service workers, and unskilled workers) could be reliably differentiated. It was even possible to differentiate between the aptitude and ability patterns of such closely related occupations as accountant and businessman. This was done by analyzing tests administered in the junior year of high school and comparing those records with groups found in the supplementary study to be working two years later in a particular occupation with the intention of remaining in that line of work.

CHAPTER VI — CURRICULUM DEVELOPMENT PROPOSAL

The development of a way to incorporate technical and vocational teaching into the school system is the key to the problem of equipping the younger population for a lifetime of productive work.

This is no easy problem—the solving of it requires a new look into the goals of education. We must use the contributions of educators from all segments; we must seek and accept the advice of the community; we must strive to blend this type of teaching into educational systems which are for the most part obsessed with the idea of university preparation.

If it is possible to broaden local school district curricula and incorporate the many suggestions in this report, then satisfaction from education for a large percentage of our citizens will accrue.

Psychology has shown that success and satisfaction give an individual the courage to continue to try. A broadened curriculum will lessen the proliferation of educational failures; a broader choice, especially in the field of practical application, will provide for opportunities for more people.

In Milwaukee, Wisconsin, figures tell a good story. This city has the most extensive program of secondary vocational education in the nation; and one of the highest rates of high school graduation. Ninety-four per cent of its students graduate from high school.

Isn't the goal of education still to make a better society—a society of individuals who are happy because they contribute to the society? Education has always been charged with giving to all who desire the skill and the knowledge necessary to make for themselves, their families, their neighbors a better life.

We mustn't shrug off those who aren't motivated towards the university. We should, rather, seek to challenge them, and to do this we must create an environment which not only allows, but encourages the setting of goals and greater output on their part.

Here then is a suggestion on how Lane County schools can develop a broadened technical-vocational curriculum without diminishing the effort placed on those students who wish university-type academic pursuits.

THE PROBLEM

The problem is to make students want to accept a general education and occupational education resulting in maximum individual development and preparation for work.

It is generally accepted that the best basis for occupational sufficiency and citizenship is for a student to become proficient in communication, skills, and ability to handle quantitive relationships, command of problem solving processes, etc. In essence then, the answer to all educational problems is to teach students to read and write and figure; easily said, but often not easily achieved.

It is imperative that the curriculum be made meaningful and purposeful to each student. Far too many students are now dropping out of school, or disinterestedly languishing in the secondary and post-secondary classrooms, simply because they have no self-satisfying alternative. It is necessary to make the reinforcement for successful behavior in school more immediate rather than a nebulous promise of a distant reward. The curriculum must give the student immediate satisfaction in terms of the present realities in his life situation. Only in this way can the school have meaning and purpose for all students.

Although the activities and concerns of men are by no means limited to a vocation, preparation for an occupation is a strong motive in the American culture. The problem is to more fully utilize the occupational desire of the individual to foster development for self-fulfillment and the maintenance of a robust society.

OBJECTIVES OF THIS CURRICULUM DEVELOPMENT PROPOSAL

The basis of this proposal is to gain the support necessary to develop more detailed plans for accomplishing the following objectives:

1. To form a Regional Vocational-Technical Curriculum Development Institute.
2. To develop and implement curriculum based on occupational opportunities.
3. To develop and implement curriculum based on an analysis of the required skills and knowledge needed for present and future occupations.
4. To develop vocational-technical curriculums that have meaning and purpose for students who are unmotivated or unsuccessful in present curriculums.
5. To utilize an interdisciplinary approach to technical-vocational curriculum development.
6. To implement, in demonstration schools, vocational-technical curriculums that have meaning and purpose for each student.
7. To utilize interdepartmental or interdisciplinary teams to instruct in the new vocational curriculum.
8. To combine the capabilities of educators with the resources of the community, business, industry, and parents for the development of optimum occupational learning.
9. To utilize a strong occupational motive in the American culture to furnish students motivation for learning.
10. To provide curriculums in which all students can find achievement and success, thus preparing them to seek and accept further learning.

PROCEDURES

Only a general outline of procedures will be developed here. There would appear to be a need for much more research, planning, and the careful selection of personnel before the project could begin. It is proposed that a principal investigator and appropriate assistants be engaged to complete the study of the needs, the methods, and to make the arrangements for the personnel necessary to proceed with a full-fledged technical-vocational curriculum development.

It should be emphasized at the outset that the Institute is designed as a cooperative undertaking in which secondary school-teachers and college specialists covering the spectrum of the secondary curriculum will work as equals, each person drawing on his specialized knowledge and experience so that the results will have a validity that could not otherwise be achieved.

More specific steps for the organization of the Regional Vocational Curriculum Development Institute and the achievement of the objectives listed are arranged below in an order similar to the order of the objectives.

1. The Institute could be guided by Oregon State Uni-

versity specialists from various subject areas with vocational emphasis. Participants in the Institute would be teachers on loan from their various local districts. This would be a format similar to "Project English" at the University of Oregon.

2. Occupational opportunity surveys have been completed by the Oregon State Employment Service and the U.S. Department of Labor. The Oregon State Employment Service and the Institute would need to cooperate closely.
3. An essential ingredient is the development of comprehensive, meaningful information about the vocations for which curricula are to be developed. This job information will be obtained through cooperation with the Oregon State Employment Service or by including labor market research specialists on the Institute staff.
4. Curricula and course content would be developed on the basis that there must be an obvious and close relationship between the course content and the realities of the students' life situation. It is further proposed that course content emphasize application which will provide tangible achievement and thus frequent reinforcement. The curriculum created should be based on the proposition that vocational-oriented content can serve as a vehicle for motivating students to learn related disciplines, in addition to student achievement of occupational competencies.
5. Since the requirements of present and future occupations do not fit the present educational departmentalization, it is proposed that teachers from various disciplines be used in the development of the vocational curricula. This would be an interdepartmental or team approach. An example might be a mathematics teacher, working with a shop teacher to provide coordination so that the mathematics being taught in the classroom would be the same mathematics the student would be using in the shop in completing a shop project. Another illustration might be the joint efforts of a shop and English teacher. The English teacher should be the best prepared to instruct the student in clear but concise communication needed for such shop related activities as the preparation of materials lists. Thus, specialists, each current in his discipline, would pool their capabilities to develop and maintain modern vocational-technical curricula.
6. Curriculum and course content is no better than the instructor who uses it. Instructors must be flexible enough to adapt the scope, sequence, and content to individual student needs. Some methods that might aid this adaptation to individual needs would be limited class size and the development of instructional aids for independent student use. The Institute could and should develop a broad spectrum of instructional aids.
7. Teachers developing the interdisciplinary vocational courses would return to their local districts to head teams implementing the courses in their schools. Although districts would agree in advance to allow the teachers to return to try the new approach to vocational courses, it would seem that it may be necessary to give the district some financial assistance for experimentation with the anticipated change in the assignment of teacher time. New materials and equipment may also be necessary and beyond the financial abilities of the local districts. Perhaps federal or foundation funds could be obtained for this purpose.
8. In addition to educators, the interdisciplinary approach could include specialists from the community at large. This has been attempted in the past by having individuals serve as resource speakers and through the use of advisory committees. Both of these methods could be expanded along with the expansion of such tried-and-true methods as field trips and cooperative work-experience programs. However, it is also proposed that community resource persons be used to advise in the planning of curricula.

   Expanded use of the community resources mentioned could become an overwhelming burden on the community, unless new methods are tried. Some suggested adaptations are the use of closed circuit television, video-tape television, and the conference telephone system. The adaptations could serve the function of field trips and resource speakers without normal limitations on the use of these resources.
9. Student motivation for learning could be greatly enhanced by keying curricula and course content to the students' normal desire to acquire skills and knowledge required to enter and progress in an occupation. This could be accomplished by starting with occupational opportunities and job analysis studies when devising curriculum and course content. Also, course content could be designed to appeal to student interests rather than "teacher knows best" determinants.
10. Student evaluation would depend less upon the labeling of students with letter grades, and more on the promotion of progressive performance leading to vocational competence. Competition would be against the individual student's past performance, with occupational competence as the principal goal.

    The evaluation procedures by which to judge the success of the innovations in vocational curriculum might be developed and directed by University of Oregon specialists in research and evaluation.

The seventeen Lane County School Districts, comprising the Lane County Intermediate Education District, would contribute teachers to the work of the Institute and open their classrooms to the experimental use of new curricular procedures and materials produced by the Institute. The Lane County Intermediate Education District includes 39 secondary schools. Lane County's total high school enrollment is approximately 14,000 students.

The Lane County high schools range from the smallest, with an enrollment of 59 students, to the largest, with an enrollment of approximately 1,800 students. These schools should furnish a sufficiently broad base for the demonstration work that would be undertaken.

Lane County has a labor force of approximately 72,000 persons. This makes it the second largest labor market in the state and the fifth largest in the Pacific Northwest. The county's basic employment is concentrated in agriculture, wood and food products, transportation, wholesale trade, and educational services. These provide an economic base for the area by exporting a large part of their business services to markets outside Lane County. Other industries primarily serve either these basic producers or the market created by the area's own population.

APPENDIX A

GLOSSARY OF TERMS

GLOSSARY OF TERMS USED IN TECHNICAL-VOCATIONAL EDUCATION

(Adapted from publication "Definitions"
Published by American Vocational Association, Inc.
Washington, D.C.)

ADULT VOCATIONAL EDUCATION—Instruction offered day or evening to adults or out-of-school youth over 16 years of age who are engaged in or are preparing to enter an occupation. Vocational education for adults is chiefly of an upgrading and updating nature, offered on a part-time basis, or of a retraining nature for persons displaced by automation or technological changes.

ADVISORY COMMITTEE—A group of persons, usually outside the educational profession, selected for the purpose of offering advice and counsel to the school regarding the vocational program. Members are representatives of the people who are interested in the activities with which the vocational program is concerned.

APPLIED ART—An area of study dealing with the principles of art as related to the planning, designing, manufacturing, or arrangement of such commodities as clothing, shelter, household furniture, and equipment

APPRENTICE TRAINING—An organized system for providing young people with the manipulative skills and technical or theoretical knowledge needed for competent performance in skilled occupations. The program usually involves cooperation among school, labor, and management, since apprentices learn the skills of the craftsman through on-the-job work experiences and the related information in the classroom. The minimum terms and conditions of apprenticeship are regulated by state and local statutes or agreements.

AREA VOCATIONAL SCHOOL OR PROGRAM—A school or program involving a large geographical territory usually including more than one local basic administrative unit. It offers specialized training to high school students, who are preparing to enter the labor market. It also provides vocational or technical education to persons who have completed or left high school and are available for full-time study. These schools are sponsored and operated by local communities or by the state.

AVOCATIONAL INTERESTS—Those pursuits or hobbies which are distinct from the regular work or occupation of the individual and which are followed for recreational purposes.

BUSINESS EDUCATION—A program of instruction which consists of two parts: (a) office education, a grading education leading to employability and advancement in office occupations, and (b) general business education, a program to provide students with information and competencies which are needed by all in managing personal business affairs and in using the services of the business world.

COMMUNITY COLLEGE—A junior college operated by the board of education of a local basic administrative unit (including the independent local board for one or more community colleges.) Instruction is adapted in content, level, and schedule to the needs of the local community.

COURSE OF STUDY—An inclusive outline of the objectives, experiences, skills, projects, demonstrations, related information, and methods involved in teaching a school subject, covering a specified period of time.

CURRICULUM—The series of courses designed to cover the instruction in a designated field. It may refer also to the whole body of courses offered in an educational institution.

DISTRIBUTIVE EDUCATION—A program of instruction in marketing, merchandising, and management. The program is concerned with training needed for purposes of updating, upgrading, career development, and operational management.

DISTRIBUTIVE OCCUPATIONS—Those occupations followed by proprietors, managers, or employees engaged primarily in marketing or merchandising of goods or services. Such occupations are found in various business establishments, including, without being limited to, retailing, wholesaling, manufacturing, storing, transporting, financing, and risk bearing.

EVALUATION—A term used in education indicating the procedure for determining the effectiveness of instruction.

EXPLORATORY COURSES—School subjects designed to provide the student with a broad, general, over-all view of the knowledges and skills involved in a field of learning or an occupation. Courses which provide students with exploratory and introductory experiences in a wide range of occupations serve as aid in choosing a vocation.

GENERAL INDUSTRIAL COURSE—A class organized to give specific preparation for an occupation in a group where shop instruction in several closely allied trades is conducted simultaneously. Courses may be organized to give preparation for one or more production jobs that do not fall into the trade classification.

GUIDANCE, VOCATIONAL—The process of assisting individuals to understand their capabilities and interest, to choose a suitable vocation, and to prepare for, enter, and make successful progress in it.

HOME ECONOMICS—The term used to designate the discipline at the college level which prepares students for such professional fields as: home economics teaching, dietetics, cooperative extension, social welfare, public health, institution administration, research.

HOME ECONOMICS EDUCATION—A program of instruction which is planned for the purpose of assisting youth and adults to understand and solve problems in home and family living and/or to prepare for employment and upgrading in occupations involving knowledge and skills in home economics subjects. Subject-matter areas include: Child development; family relationships; food and nutrition; clothing and textiles; family economics and home management; housing, home, furnishings, and equipment; and, family health.

HOMEMAKING EDUCATION—A term frequently used to designate secondary and adult programs which have as their goal education for home and family living. (see home economics education)

INDUSTRIAL ART—Application of the principles of design to the planning and production of manufactured products.

INDUSTRIAL ARTS EDUCATION—Instructional shopwork of a non-vocational type which provides general educational experiences centered around the industrial and technical aspects of life today and offers orientation in the areas of appreciation, production, consumption, and recreation through actual experiences with materials and goods. It also serves as exploratory experiences which are helpful in the choice of a vocation.

INDUSTRIAL EDUCATION—A generic term applying to all types of education related to industry, including industrial arts education, vocational industrial education (trade and industrial education), and much technical education.

JOB ANALYSIS—A detailed listing of duties, operations, and skills necessary to perform a clearly defined, specific job, organized into a logical sequence which may be used for teaching, employment, or classification purposes.

OCCUPATIONAL INFORMATION—Systematically organized data used by guidance personnel for the purpose of helping persons make a vocational choice. Material concerns the nature of the work, duties, responsibilities, and compensations involved in the several vocations, including information about employment outlook, promotional opportunities, and entrance requirements.

OFFICE EDUCATION—A vocational education program for office careers through initial, refresher, and upgrading education leading to employability and advancement in office occupations.

OFFICE EDUCATION CURRICULA—A series of related and required courses leading to vocational competency in a specific occupational category which is taken in addition to the required subject matter taken by all students. Typical occupational curricula include: (a) stenographic, typing, filing, and related occupations, (b) computing and accounting occupations, (c) material and production and recording occupations, (d) information and message distribution occupations, (e) accounting, auditing, budget, and management analyst occupations, (f) personnel and training administrative occupations, (g) administrative specialization occupations, (h) miscellaneous clerical occupations, (i) supervisor office position occupations, (j) management office facilitation function, (k) data processing occupations.

OFFICE OCCUPATIONS—Those activities—performed by individuals in public and/or private enterprises—which are relataed to the facilitating function of the office. They include such items as recording and retrieval of data, supervision and coordination of office activities, communication, and reporting of information regardless of the social, economic or governmental organization in which they are found. The "Dictionary of Occupation Titles" provides a source of information concerning the nature of office occupations.

ON-THE-JOB TRAINING—Instruction in the performance of a job given to an employed worker by the employer during the usual working hours of the occupation. Usually the minimum or beginning wage is paid.

PRACTICAL NURSE EDUCATION—A program offering training in approved schools and leading to licensure as a practical or vocational nurse. The trainee is being prepared to (a) give direct nursing care to patients whose health situation is relatively stable, (b) assist qualified professional nurses in caring for patients whose health situation is more complex. The minimum requirements are set by the state board for vocational education while it is accredited by the profession for meeting desirable standards and licensed by the state in order to protect society from malpractice and incompetent individuals.

PRIVATE VOCATIONAL SCHOOL—A school established and operated by an agency other than the state or its subdivisions, and supported by other than public funds, which has as its purpose the preparation of students for entrance into or progress in trades or other skilled occupations.

PROJECT—An article, activity, investigation, or problem chosen by or assigned to a student. The student is assisted by the teacher in its planning and completion.

PUBLIC VOCATIONAL SCHOOL—A secondary school under public supervision and control and supported by public funds which provides instruction that will enable high school youth and adults to prepare for, enter, and make progress in a skilled trade or occupation of their choice.

SKILLED MECHANIC—One competent to perform, with a high degree of expertness, the work in one or more specialized divisions of a given trade.

SKILLED OPERATOR—One competent to perform efficiently and expertly one or more kinds of repetitive production or single purpose jobs on machines or other special equipment demanding manual dexterity.

SURVEY, COMMUNITY—A fact-finding study of socio-economic conditions and resources, community agencies, industries, business, farming, institutional practices, problems and practices of families, etc., as they exist at a given time in a given community. It is used by the school as a guide in revising school offerings to meet local needs.

SURVEY, OCCUPATIONAL—An investigation and evaluation to gather pertinent information about a single industry or the occupations of an area to determine the need for training, the prevalent practices, the labor supply and turnover, for the purpose of maintaining the vocational program at a realistic level.

SURVEY, VOCATIONAL EDUCATION—A study to obtain necessary information as a basis for the proper development of programs of vocational education. It serves to identify the needs for vocational training, recommend suitable types of classes, assist in the development of new instructional processes, and evaluate the results of work already done.

TECHNICAL EDUCATION—Education to earn a living in an occupation in which success is dependent largely upon technical information and understanding of the laws of science and principles of technology as applied to modern design, production, distribution and service.

TECHNICIAN (INDUSTRIAL)—A worker on a level between the skilled tradesman and the professional scientist or engineer. His technical knowledge permits him to assume some duties formerly assigned to the graduate engineer or scientist. For example, technicians may design a mechanism, compute the cost, write the specifications, organize the production, and test the finished product. There are technicians in other occupational fields.

TERMINAL COURSE—One which completes the subject matter of a specific area with employment as the immediate objective.

TRADE AND INDUSTRIAL EDUCATION — Instruction which is planned to develop basic manipulative skills, safety judgment, technical knowledge, and related occupational information for the purpose of fitting persons for initial employment in industrial occupations and upgrading or retraining workers employed in industry.

UNIT OF INSTRUCTION—The smallest division of instruction for which a full lesson is taught. A single operation in a trade may constitute a unit of instruction.

VOCATIONAL CURRICULUM—A carefully selected group of courses or a sequence of subjects the content of which will provide the necessary skill and knowledge for success in a specific occupation.

VOCATIONAL EDUCATION—"Vocational or technical training or retraining which is given in schools or classes (including field or laboratory work incidental thereto) under public supervision and control or under contract with a state board or local educational agency, and is conducted as part of a program designed to fit individuals for gainful employment as semi-skilled or skilled workers or technicians in recognized occupations (including any program designed to fit individuals for gainful employment which may be assisted by federal funds under the Vocational Education Act of 1946 and supplementary vocational education acts, but excluding any program to fit individuals for employment in occupations which the Commissioner determines, and specifies in regulations, to be generally considered professional or as requiring a baccalaureate or higher degree). Such term includes vocational guidance and counseling in connection with such training, instruction related to the occupation for which the student is being trained or necessary for him to benefit from such training, the training of persons engaged as, or preparing to become, vocational education teacers, teacher-trainers, supervisors, and directors for such training, travel of students and vocational education personnel, and the acquisition and maintenance and repair of instructional supplies, teaching aids and equipment, but does not include the construction or initial equipment of buildings or the acquisition or rental of land." As defined in Public Law 88-210.

VOCATIONAL EDUCATION ACT OF 1963—Enacted "to authorize federal grants to states to assist them to maintain, extend, and improve existing programs of vocational education, to develop new programs of vocational education, and to provide part-time employment for youths who need the earnings from such employment to continue their vocational training on a full-time basis, so that persons of all ages in all communities of the states—those in high school, those who have completed or discontinued their formal education and are preparing to enter the labor market, those who have already entered the labor market but need to upgrade their skills or learn new ones, and those with special educational handicaps—will have ready access to vocational training or retraining which is of high quality, which is realistic in the light of actual or anticipated opportunities for gainful employment, and which is suited to their needs, interests, and ability to benefit from such training." As defined in Public Law 88-210.

VOCATIONAL SCHOOL—A school which is organized separately under a principal or director for the purpose of offering training in one or more skilled or semi-skilled trades or occupations. It is designed to meet the needs of high school students preparing for employment and to provide upgrading or extension courses for those who are employed.

VOCATIONAL SUBJECT—Any school subject designed to develop specific skills, knowledges, and information which enable the learner to prepare for or to be more efficient in his chosen trade or occupation.

WORK EXPERIENCE—Employment undertaken by a student while attending school. The job may be de-

signed to provide practical experience of a general character in the work-a-day world.

WORK EXPERIENCE EDUCATION (OCCUPATIONAL EXPERIENCE)—Employment undertaken as part of the requirements of a school course and designed to provide planned experiences, in the chosen occupation, which are supervised by a teacher-coordinator and the employer.

NEIGHBORHOOD YOUTH CORPS

WORK STUDY PROGRAM—Administered by the local educational agency and made reasonably available (to the extent of available funds) to all eligible youths in the area served by such agency. Employment under the program may be for the local educational agency or some other public agency or institution and will be furnished only to students who (a) have been accepted for enrollment as full-time students in an approved vocational education program, (b) need earnings to continue their vocational education, and (c) are at least 15 and less than 21 years of age. No student shall be employed under the program more than 15 hours in any class week or paid more than $45 in any month or $350 in any academic year, except in special cases.

TABLE 15

EQUIPMENT INVENTORY

Considerable time and discussion was devoted to the areas of existing equipment inventories and facilities. It was concluded that if we were to attempt to analyze our present program in the light of adequacy and directions, we not only needed to know what we are teaching but also what equipment and facilities we had to work with.

Each Principal was visited and inventory sheets were distributed and procedures for conducting the inventory discussed. Information gathered in the equipment and facility portion of the Inventory Phase is presented in Tables 15 and Tables 16.

AUTOMOTIVE TEST EQUIPMENT	Number of Schools Reporting	Quantity on Hand
a. Dyna Vision	1	2
b. Electrical system	3	4
c. Fuel system	1	1
d. Generator & starter	1	3
e. Battery		1
f. Motor analyzer	2	4
g. Small Engine Handkit	1	10
h. Timing Light	1	1
i. Dwell Tach.	2	2
j. Vacuum Indicator	2	2
k. Compression Gauge	2	2
Kits Automotive Handtools	4	29
Kits Body & Fender Handtools	3	2
Tap & Die Sets	11	23
Jacks (Hydraulic)	4	14
Jacks (Mechanical)	1	1
Benches w/vise	7	80
Test Benches	1	4

AUTOMOTIVE TEST EQUIPMENT (continued)

	Number of Schools Reporting	Quantity on Hand
Creepers	4	31
Stands	2	34
Porta-powers		5
Spray paint equipment	6	10
Forge	3	4
Foundry	1	3
Heat furnace	1	1
Testers (metal)	2	2
Electric saw (portable)	4	5
a. ¼"	3	3
b. ½"	2	2
c. ⅜"	3	2
d. Larger		
Buffers (electric portable)	3	4
Air Wrench		
Electric Wrench		1
Air Compressors	6	10
Steam Cleaners	1	3

TRADE AND INDUSTRY

Metals—Equipment

	Number of Schools Reporting	Quantity on Hand
Welders (Arc)	9	55
Spot Welders	3	10
Welding Equip. (Acet.)	8	54
Drill Presses (Bench)	6	21
Grinders (Bench)	12	45
Metal Lathes (Bench)	3	10
Presses (Bench)	3	6
Milling Machines (Bench)	3	9
Valve Grinders	3	6
Brake Drum Lathes	1	121
Metal Lathes	6	36
Drill Presses	11	35
Metal Shapers	3	12
Metal Sanders	1	4
Metal Saws (Band)	4	11
Metal Saws (Oscillating)	3	5
Shears (Electric or hydraulic)		1
Shears (Manual)	6	23
Metal Buffers (Bench)	3	16
Metal Polishers (Portable)	2	6
Sheet Metal Rolls	5	5
a. Slip Rolls		2
b. Metal Bender	2	2
c. Bar Folder	1	1
d. Floor Grinder	2	2
Sheet Metal Brakes		
a. Pan Brake	6	12
b. Box Brake		2
c. 24" Brake	1	1
d. Rotary Machine	1	1
e. Stake Set	1	1
Buffer Floor	1	1

Woods—Equipment

	Number of Schools Reporting	Quantity on Hand
Table Saws	21	35
Radial Saws	16	19
Jig Saws	19	28
Band Saws (small)	12	16
Band Saws (large)	10	12
Portable Saws		
a. Circular	10	17
b. Saber	13	16
Sanders (belt)	16	26
Sanders (Disc)	14	21
Sanders (Portable)	14	44
Sanders (Spindle)	3	6
Lathes w/tools	20	79
Joiners (small)	13	21
Joiners (large)	9	17
Planers (size)	12	34
Shapers & Formers	9	9
Milling Machines	1	
Steaming tubs	2	1
Drying Ovens		
Kits, Hand Tools (Wood)	17	135
Kits, Hand Tools (Crafts)	7	73
Kits, Hand Tools (Mechanical)	3	21
Blow Torches	3	3
Torches (Propane)	5	11
Polishers & Buffers	9	74
Benches w/vise	17	174
Drill Press	12	12
Hand Drill	2	1
Grinder	4	11
Paint & Sprayer	2	8
Dust Control Unit	1	1
Compressor & Gun	1	1

Plastics—Equipment

	Number of Schools Reporting	Quantity on Hand
Laminating Press (small)	2	2
Laminating Press (large)		
Band Saw (small)	1	4
Band Saw (large)	1	1
Drill Press (small)	2	4
Drill Press (large)	2	2
Spindle Sanders	1	1
Band Sanders		
Disc Sanders	1	2
Portable Sanders	1	5
Turning Lathes	2	8
Heat Furnace	2	5
Press (small)		1
Press (large)		
Jig Saw	3	4
Buffers & Polishers (portable)	2	3
Saws (Saber)	1	3

EVALUATION PHASE

EVALUATION TABULATIONS

The following tables are the result of the series of evaluative studies conducted on the secondary level in the Lane County Technical-Vocational Survey.

A modification of the National Evaluative Criteria was used in the areas of agriculture, arts and crafts, business education, distributive education, industrial arts, technical vocational subjects, home economics and guidance.

TABLE 17-1 — BASIC PUPIL DATA ENROLLMENT TABLE

No. of Schools Reporting—16

Grade	1961-62	1962-63	1963-64	1964-65

APPENDIX D

HOW TO TEACH SKILLS ESSENTIAL TO WORK IN THE TIMBER INDUSTRY

Note: One of the most specific recommendations of this report is that all high schools should teach courses related to employment in Lane County's primary industry—timber harvesting and processing. Therefore, here is the result of considerable research compiled into a suggested course of study, along with a program outline for a basic course.

TABLE 18

CLUSTER ANALYSIS FOR TIMBER PRODUCTS INDUSTRY

Assignment of Responsibility for Education Courses Compatible With Occupations in "The Timber Products Cluster of Occupations"

COURSE UNITS	Jr. High	Senior High Lge.	Senior High Med.	Senior High Sml.	Com. Coll.
General Education	x	x	x	x	
Orientation for Career	x	x	x	x

Industrial Economics		x	x	x	x
Forest Field Operations		x			x
Forest Measurement					x
Logging Planning					x

*Since the teaching of attitudes, responsibilities and work dynamcs is an essential part of this program, it is strongly urged that work laboratory programs be incorporated into the educational program at a relatively early level.

A SUGGESTED PROGRAM OF STUDIES IN TIMBER HARVESTING AND PROCESSING OCCUPATIONAL SKILLS

Grades 9, 10, 11, 12

GOALS AND OBJECTIVES OF THIS PROGRAM:

1. Create academic and work experiences in the program that will lead to employment and success for the individual in the forest products industries.
2. Teach safety and care of equipment and personal property.
3. To teach how to prepare for the job and develop responsibility for care of personal property on the job.
4. To develop sufficient skill and understanding to read and understand the material that must be understood in order to perform as a member of our labor force.
5. Teach responsibility to:
   a. Himself
   b. His group
   c. His leader
   d. His class
6. To teach the student how to:
   a. Plan work
   b. Plan his personal economy and spending
   c. Coordinate work with others
   d. Respond to "work cues" from foreman or other leaders
7. To develop a future citizen worthy of a place in a democratic society such as ours, with a basic understanding of an economy and factors affecting economic growth.
8. To encourage the student to pursue education to develop technical skills in orlder to obtain better jobs.
9. To create interest in the world around us, to understand nature and natural resources.
10. To place our graduates in jobs in the local labor market—"forest products industry," and to evaluate their

SUGGESTED CONTENT OF EDUCATIONAL COURSE OFFERINGS FOR THE JUNIOR AND SENIOR HIGH SCHOOLS TO DEVELOP SKILLS NECESSARY FOR ENTRY INTO THE TIMBER PRODUCTS INDUSTRY

1—Shop Skills:

A. Hand tools, identification, care and proper use
B. Basic operations using hand tools
C. Project planning, layout and construction
D. Finishing materials and their use
E. Identification, grading and proper use of
   1. Wood Products
      a. "Hard wood" lumber
      b. Various "soft wood" lumber
      c. Plywoods and veneers
      d. Particle and chip boards
      e. Pressed boards
      f. Laminated woods
   2. Metals
      a. Fastening devices
      b. Structural materials
      c. Fabrication and construction
   3. Plastics and Resins
      a. Adhesives
      b. Finishes and surfacing materials
      c. Reinforcing and coating resins
      d. Structural plastics
      e. Decoration and trim
   4. Sharpening devices, abrasives and finishing papers
   5. Identification and instruction in proper use of lubricants and anti-friction agents in operation of tools and equipment
F. Introduction and instruction in care and use of portable power equipment
   1. Electric saws, sanders, drills, etc.
   2. Air driven tools
   3. Hydraulic tools
G. Introduction and orientation in care and use of stationary, heavy duty power tools
H. Projects to gain practice and proficiency in use of media, materials, and equipment
I. Introduction to layout, plans and general drafting
J. Introduction to principles of electricity and magnetism

2—WOOD USES AND FABRICATION

A. Instruction in kinds of woods—identification and grading
B. Introduction to wood products and uses
C. Instruction in basic hand tools and portable power tools
D. Instruction in structural carpentry
F. Instruction in sheeting
G. Instruction in roofing
H. Instruction in carpentry and cabinet making

3—METALS AND METALS FABRICATION

A. Basic instruction in processing of iron ore
B. Basic instruction in pattern layout—measurements
C. Instruction and practice in cutting of metal—folding and forming
D. Instruction and practice in filing and piercing—drilling, tapping, seams
E. Instruction and practice in fabrication and conduit work
F. Instruction and practice in riveting and finishing
G. Instruction and practice in tubing and pipe—threading and installation—plumbing
H. Instruction and practice in welding and machine tools

4—PLASTICS AND FINISHING MATERIALS

A. Instruction in related information
B. Instruction in cutting plastics
C. Instruction in laminating plastics
D. Instruction in finishing plastics
E. Instruction in cementing plastics
F. Instruction in clear seams
G. Instruction in structural plastics, synthetic finishing agents

5—BASIC ELECTRICITY

A. Principles of electricity
B. Dry cell battery
C. Direct current and magnetism
D. AC-DC generators and transformers
E. Simple electrical repairs
F. Electric motors
G. Electrical layout and installation—Ohms law
H. Basic electronics
I. Series and parallel circuits

6—DRAFTING AND BLUE PRINT READING

The student should acquire ability to read and make working drawings. He should acquire basic knowledge of various fields where mechanical drawing is used, and ability to make three-view drawings to scale with full dimensions, with accuracy and acceptable drawing techniques.

Students make working drawings of advanced projects including sketches and tracings. They design and make assembly and detail drawings of small machines, articles of furniture, house plans, or other industrial products, and use tables, handbooks, and standard reference material.

Emphasis is given to the development of the ability to use the common drafting instruments in making working drawings and the development of habits of careful, precise workmanship.

Students should develop ability to describe the shape and size of objects through the language of drawing, and to understand and read drawings and blueprints. They should gain knowledge of the occupational opportunities and requirements of industry.

Students engage in lettering plates, geometric construction, isometric and oblique drawings, orthographic projection (three views), sections, auxiliary views, developments, and perspectives (two-point) drawings.

7—SCIENCE

We should plan to develop a functional science program related to the Timber Products Industries and offer instruction in the following basic areas:

A. The scientific method and problem solving
B. Animal life—game management, as related to forestry
C. Water—effects, erosion, control, hydraulics
D. Weather—humidity, effects of temperature change
E. Light
F. Sound
G. Use and control of fire, care of combustibles, heat
H. Electricity and magnetism
I. Industrial chemistry
J. Foods and nutrition
K. Tobacco, alcohol and narcotics (required by State Law)
L. Plant life—botany, forestry
M. First aid and safety
N. Force and motion
O. Mechanical energy
P. Human body—disease, reproduction, heredity
Q. Metallurgy

8—COMMUNICATION SKILLS FOR NON-ACADEMICALLY ORIENTED STUDENTS

A. Provide remedial instruction in reading to all enrollees who have demonstrated an inability to function adequately in this area, concentrating on materials that are functional to these needs, i.e., technical bulletins, instructions, morale, current communication media, elementary quasi-legal matter, fiction and other entertaining material.
B. Develop a functioning competency in written and oral expression especially in the areas of: requests for information, letters of application, descriptive summaries, personal correspondence, fluency in the use of oral expression and procedures to enable the enrollee to participate in union meetings, church, school, and other community affairs.
C. Improve listening comprehension skills in order that the student can profit from participating in lectures, discussions, demonstrations, and community forums.

9—MATHEMATICS

Regardless of what additional mathematical skills might be necessary, the students must be familiar with all the basic skills of arithmetic, of addition, subtraction, multiplication and division of whole numbers, fractions and decimals.

In addition to these basic mathematical skills, the following concepts are necessary to various areas of the program:

A. Measurement (linear, square, volume)
B. Bookkeeping—scheduling of work hours (in perhaps a graph or matrix form)
C. Basic trigonometric concepts (for surveying, etc.)
D. Equation solving, ratio and proportion, tolerances, estimation of quantities, graphing
E. Geometric concepts (in relation to construction)
F. Lumber measurement and estimation (board feet, etc.)

10—GENERAL FORESTRY PRODUCTS AND USES

(Course of Study in Forestry attached)

11—INDUSTRIAL ECONOMICS

Industrial Economics deals with the principles involved in the operation of the American economic system. The role of business and industry in the total economy is studied. Basic economic principles are applied to the re-

lationship of employer and employee. Topics considered include historic trends, business organization, price and competition, imperfect competition and monopoly, price levels, business cycles, taxation, labor unions, management associations, labor-management relations, and social and private security.

12—FOREST FIELD OPERATIONS

A general course in Forest Measurements starting with log scaling, going into log grading, and finally cruising methods. The necessary theory will be presented along with practical work in each field.

13—ORIENTATION FOR CAREERS

Screening of students by counselors to determine the desires, goals and basic talents of each. This should be done in individual counseling sessions with each student at the 9th grade level. As a product of this counseling session, or sessions, plus careful study of cumulative records, parent interviews should be conducted, followed up with a specific test program: i.e., Kuder Interest Inventories, D.A.T. Test, or any other instrument that would aid the counselor and student to arrive at a planned high school program that is both compatible in the schools. The screening, an analysis part of the guidance program, should not terminate with the setting up of a program of study and work. One of the real values of this secondary vocational program should be the value of negative experience. By that, we mean a student has the talent, aptitude, and expressed desrie for an area such as construction work. After some experience working this area in the project, certain negative attitudes develop. These can be very valuable to the student, inasmuch as he has positive knowledge he does not like this area. If the staff maintains contact, this knowledge can be valuable in helping the student select another occupation or course of instruction to pursue. The analysis and orientation process should continue through the entire secondary school career.

14—SUGGESTED CONTENT FOR WORK LABORATORY EXPERIENCES

A. Instruction in care and preparation of hand tools. Description of nomenclature and proper uses for specific tools.

B. Assembly of tools and materials for specific jobs and development of procedures for storage and protection of tools and materials.

C. Safety instructions
   1. First aid
   2. Protective clothing
   3. Working as a team
   4. Protective procedures when dealing with reptiles, poison plants, exposure to weather and job hazards
   5. Firefighting

D. Social Dynamics of working together in work activities
   1. Social instructions for group activities
   2. Response to cues by leaders and "foreman"
   3. Responding to friction and learning to develop mutual respects and trusts when working in a small group.
   4. Importance of reinforcement within the groups of positive experiences.

E. Planning progressive work projects and meeting time schedules
   1. Absenteeism and its effects on work programs
   2. Working at a steady pace in order that different teams can work together in a coordinated program.
   3. Discussing the importance of coordination of labor and materials in order to progress in an orderly, effective manner
   4. Learn importance of developing realistic time schedules.

F. Learning to prepare for work experiences
   1. Adequate clothing
   2. Lunch
   3. Bring proper tools to job

G. Projects and activities for work laboratory activities
   1. Construct and install benches, cabinets, storage racks
   2. Install and use machinery for care of tools (stones, grinders, oil, etc.)
   3. Prepare and use clothing storage facilities and learn importance of care of facilities
   4. Learn to operate portable generators to supply power for machinery and lighting.
   5. Install and operate communication equipment.
   6. Learn to perform duties and accept responsibilities for the job of:
      a. Tool room clerks
      b. Cleanliness
      c. Foreman for crews
      d. Safety and first aid crews
   7. Study and use of transits, levels, tapes, squares in planning and developing project areas and buildings
      a. Drainage
      b. Construction of sanitary facilities
      c. Workshop
      d. Recreation area
      e. Parking area
      f. Administration center
      g. Other structures and areas that fit into future plans

   8. Organize work projects and develop a time table for projects
      a. Order materials
      b. Assemble tools
      c. Develop work schedule
   10. Develop a surface drainage plan for land areas
      a. Construct terrain contour maps
      b. Read planning commission, health authority, and government bulletins on drainage and construction of septic tank drainage fields
      Construct drainage line blueprints
      d. Order diameter of tile and gravel for bed needed for drainage lines

e. Plan drainage and sanitation projects and deter-
yards of dirt that need to be moved to lay drain
age fields
f. Prepare excavation and beds, install tile, and re-
cover

11. Prepare and develop areas for recreation and general usage
    a. Layout parking area, establish size and shape of present and future needs
    b. Determine surfacing problems and materials
        1 - Calculate needed yardage of different dimensions of surfacing rock
        2 - Use transits and levels to determine grade of parking area
        3 - Using power and hand tools, level area and prepare for receiving surfacing materials
        4 - Coordinate orders and delivery of material in order to have adequate material on site for each day's work
        5 - Develop plans for finishing of parking area including use of natural shrubs in landscaping and placing of small timbers to designate and mark off parking spaces

12—BUILDING STRUCTURES FOR SCHOOL OR PUBLIC USE

13—INSTRUCTION, DEMONSTRATION AND PRACTICE IN THE BASIC SKILLS AND TECHNIQUES UTILIZED IN THE TIMBER HARVESTING INDUSTRY

A. Learn firefighting skills
B. Learn to "thin" and "prune" timber
C. Learn to use, care for, maintain power equipment, ie., power saws, fire tanks, trucks, tractors, choker setting, post hole digging, etc.
D. Learn to cruise timber, use increment borers, diameter tapes
E. Learn to repair and maintain trails and fire breaks

COURSE OF STUDY FOR FORESTRY I

The manufacture and sale of forest products is a basic economic activity in Oregon and Lane County. Our economic structure depends partly upon our forest.

OBJECTIVES AND GOALS:

1. Show the vital importance forestry plays in our national welfare
2. Show the vital importance forestry plays in our local welfare
3. To have the boys gain an appreciation for the forests by knowing:
    a. Identification of trees
    b. Conservation of our resources, including game and water
    c. How to survey forests from the standpoint of:
        (1) measuring timber
        (2) road construction, etc.
    d. The ways that forests are destroyed and the results in not only dollar losses, but intangible losses
    e. How to reforest areas that have had the timber removed.

FACTORS TO BE CONSIDERED IN UNIT CONSTRUCTION:

A. Oregon
    1. Land area (total) 62 million acres
    2. Forest land area 30 million acres
    3. Oregon has 1/5 nation's timber production
    4. Oregon ranks first in the production of logs, lumber, plywood and particle board
    5. Forest industries give direct employment to 74,000 persons, and a pay roll of more than $410,000,000
B. Lane County
    1. Land area (total) 3 million acres
    2. Forest area 2½ million acres
    3. Lane County has more timber than any STATE, except Washington, Oregon, California, or Alaska
    4. 22% of all employees work in the forest products, with a payroll of over $82,000,000

SCOPE AND SEQUENCE OF INSTRUCTIONAL PROGRAM FORESTRY I

Unit I. The forest
    1. Definition of a forest
    2. Kinds of forests
    3. The forest community
Unit II. Forests and men
    1. Man's dependence on forest through the ages
        a. Forests and ancient civilization
        b. Forests in the middle ages
        c. Forests during the colonial period
        d. Forests and modern civilization
Unit III. Forest values
    1. Forest products
        a. Manufactured wood products
        b. Poles, piling, posts
        c. Pulp and paper products
        d. Naval stores
        e. Fuelwood
        f. By-products: plastics, tanning materials, food, nuts, nursery stock, charcoal, medicinal products, alcohol, etc.
        g. Fish and game
        h. Forage for domestic animals
Unit IV Water conservation
    1. Effect on economy
    2. Growing problems
    3. Legal aspect
    4. Conservation practices

LABORATORY EXPERIENCES FOR FORESTRY I

I. Wood use and identification
    A. Classification
    B. Leaf and foliage
    C. Soil treatment
    D. Use of common forestry tools
II. Climate belts and related growth
    A. Types of wood and usages
        Lectures and demonstrations
    B. Plant culture
    C. Effects of natural enemies on forest growth

Leadership Education, Individual and Group.

Robertson, Dean * and others

Montana State Univ., Bozeman. Dep. of Agr. Education

65

DOCUMENT NOT AVAILABLE FROM EDRS 119p.

MEETINGS, *STUDY GUIDES, *LEADERSHIP, ORGANIZATIONS (GROUPS), BIBLIOGRAPHIES, GROUP DYNAMICS,

A 1965 summer school class used suggestions from teacher educators and supervisors from most of the states and articles in "Agricultural Education Magazine" and "Adult Education Magazine" in developing this study guide. Such organizational problems as meetings, attendance, facilities, officer selection, parliamentary problems, work programs, committees, recruitment, resource materials, social activities, financial activities, communication, and evaluation are examined. Group dynamics, citizenship, advisory duties, teamwork, decision making, democratic principles, moral leadership, attitudes, listening, oral communication, personal appearance, hard work, and personal traits as components of leadership are explained. Study questions are given at the end of each chapter and additional readings are included. (EM)

IN APPRECIATION

This work on leadership represents the group effort of a number of persons and institutions. Most of the fifty states sent in their contributions. Teacher Educators and Supervisors in Agricultural Education were most generous and encouraging with their ideas and written materials based on years of experience with the FFA and other youth and adult organizations.

The Agricultural Education Magazine was a rich source of articles on leadership training and performance. The Adult Leadership Magazine of the American Adult Education Association was tops on group leadership concepts. Several books proved very helpful. A certain synthesis needed to be done. Our first concept of leadership embodied the image of the individual leader. In contrast, our emphasis gravitated much, much more to the power and influence of group or corporate leadership.

This publication is a 1965 summer school project with an editing committee of Dean Robertson, Wesley Budke, Bill Chiesa and other class members: Harold Brown, Vernon Dahlstrom, Leonard Enander, Glenn Gore, Cedric Huesby, Alden Irish, Harold Johns, William Kober, Robert Marlenee, Howard Pearson, Don Elser, and Luther Lalum.

This is a publication of the Agricultural Education Department of Montana State University at Bozeman.

Leo L. Knuti, Head
Agricultural Education Department

Bozeman, Montana

1 THE NEED AND DEVELOPMENT OF INDIVIDUAL AND GROUP LEADERSHIP

NEEDS

Business, agriculture, politics and international affairs are all in competition for well-trained leaders. Corporate organizations realize there is no foreseeable limit to progress under competent leadership. Changing conditions in our society bring about the need for action in critical situations. More and more dependence is being placed on individuals and groups who have the ability to guide others in their actions and decisions.

LEADERSHIP EDUCATION

A vast storehouse of leadership may be found in the young people of every community and country. Only by a well-coordinated program of leadership development may this potential energy be released into useful leadership energy. This is truly an educational process whereby the individuals are exposed to the various facets of leadership. Then they are given the opportunity to develop the necessary attitudes, interests and appreciations of leadership as well as the development of the necessary skills and abilities. Likewise, they need the opportunity to comprehend the importance of leadership in its various forms and the opportunity of applying or practicing their newly gained knowledge.

LEADERSHIP CAN BE LEARNED

It is the purpose of this publication to highlight various components of leadership education. There is a need to teach leadership, just as there is a need to teach mathematics or history. And, to stress the value and importance of corporate leadership without neglecting the importance of individual leadership.

2 GROUP LEADERSHIP OBJECTIVES

WHY OBJECTIVES

Objectives are what give direction to a program. Objectives are further needed to supply a basis for evaluating efforts and activities. Every program should be periodically evaluated. The same is true of individual efforts. Following are separate statements of objectives for both group and individual leadership. Programs of work and study should reflect objectives. Evidences need to be identified of the accomplishment of objectives. The overall objective of group leadership is to use our democratic processes to develop organizations composed of a few or many individuals skilled in the arts of group effort to achieve desirable goals.

SPECIFIC GROUP LEADERSHIP OBJECTIVES ARE TO:

1. Realize the value of well-organized committees and meetings and the important part that group dynamics can play in their success.
2. Learn the art of officer selection and training.
3. Develop challenging programs of work and adequate financing.
4. Secure adequate numbers of new members and maintain the interest of old members with emphasis on both work and fellowship.
5. Practice evaluation of group efforts by advisors, officers and members.

3 MEANING OF LEADERSHIP

To be able to define leadership in a way that would be applicable to all situations is almost an insurmountable task. In examining the literature, one can find almost as many definitions as there are writers. We need to distinguish between the words "leaders" and "leadership" and their meanings as individuals and groups.

DEFINITIONS OF A LEADER AND OF LEADERSHIP

Leadership has been described as: "A social phenomenon requiring an interaction between two or more persons."[1] A leader is said to be a person who has the know-how required at different times in a group situation and who can help the group achieve its ends. Leadership is said to be "the cement unifying men for cooperative action in order to achieve given objectives."[2] What can be learned from these definitions? A very short summary definition would be to say, "A leader is a guide." Most persons can readily conceive a picture of a guide. Someone who shows the way. Someone who helps us find the right path. One who will take the time to explain. One who is not afraid to put his shoulder to the wheel and push if others become stuck.

LEADERSHIP IN THREE DIMENSIONS

We can easily visualize a "dictator-type" of leader, shouting and waving his arms from a balcony to a group of people down below. In second dimension we see the man on a white horse with a group tagging along behind. The "high and mighty-type" individual. This picture is also easy to paint or see.

---

[1] Bogardus, Emory S., "Leaders and Leadership," New York, D Appleton Century Co.
[2] Titus, Charles H., "The Processes of Leadership," Dubuque, W.C. Brown Co., 1950, p. 52.

However, in our third dimension the leader is not so easily visualized. There is a picture of a group of people. They are accomplishing things, but where is their leader? One of them must be a leader, but which one? Possibly several are leaders. By putting on the so-called third dimension glasses, the ones with the built-in definition of a leader, it is easy to see the true picture. The group is doing the leading, not just an individual.

GROUPS: THE KEY TO EFFECTIVE LEADERSHIP

The idea that the individual leader runs the organization should be minimized, for there would be no organization without the group. Only in extreme situations, such as in war, is it necessary for individual leadership to prevail. Even then, the military staff work as a group to plan the battle with only the final order to proceed being given by an individual. Group leadership is really the key to success for any organization. Of course, there is usually someone in the group who acts as a "guide," but it is the group that is responsible for getting the job done. Effective group leadership should be sought for by all organizations.

KINDS OF LEADERS

Leaders are most commonly recognized on the basis of the roles they perform. Some of these are as follows: Advisory Leaders, Business Leaders, Area Leaders, Music Leaders, Community Leaders, Group Leaders, Political Leaders, Junior Leaders, Military Leaders, Institutional Leaders.

On the basis of their decision-making function, leaders are sometimes classed as Autocratic, Democratic, and Laissez-faire. The Autocratic Leader is the person who uses more absolute power than the other types. He alone makes major plans, dictates the activities of the members and seeks power at any cost. He merely uses people to reach his own goals. The Democratic Leader treats the individual with dignity and respect. He strives to obtain maximum participation from every

member in the group. He seeks to spread responsibility and reduce conflict within the group. The Laissez-faire leaders have little knowledge of leadership and care little for the group they represent. They are the "do nothing-type" leaders. They allow unlimited individual freedom and, as a result, little is accomplished. Perhaps for our potential leaders, the three dimensional pictures of leadership would be easier to keep in mind:

In 1st dimension: The "dictator-type" - shouting and waving his hands.

In 2nd dimension: The "high and mighty-type" - riding his big white horse.

In 3rd dimension: The "group and their guide" - getting the job done to the satisfaction of everyone concerned. This concept also includes the principles of democratic leadership.

STUDY QUESTIONS

1. What is the common error in describing leadership?
2. Explain why the group is more important than the individual in leadership.
3. Define advisory leaders, business leaders and community leaders.
4. Define autocratic leaders, democratic leaders, and laissez-faire leaders.
5. What are the three dimensions of leadership?

4 ORGANIZATIONS PERSONIFY LEADERSHIP

Organizations provide an excellent means of furthering individual and group leadership. This may be a youth group or an adult church or civic group. Organizations are a major part of our American way of life. An organization embodies many factors related to group success. Organizations encourage freedom of speech and the birth of new ideas. It makes it possible for an individual to be identified as a part of the group, and be able to understand the responsibilities and objectives of the group. Organizations have purposes or objectives. Regardless of the kind of group, there are certain leadership abilities and education and opportunities for service which an organization offers its members and its community.

CONTRIBUTIONS OF AN ORGANIZATION TO ITS MEMBERS

It is natural to assume that most people join organizations to receive some personal gain or satisfaction, but they should not lose sight of the over-all group objectives. Leadership training and education should be a major reason for belonging to organizations. Individual and group leadership may be developed in a variety of ways by an organization. Communication in the form of speaking skills and writing can be learned through groups. Parliamentary procedure or recommended practices for conducting business can best be learned in organized groups. A cooperative attitude will develop when working with and exchanging ideas with other people. Responsibility goes hand-in-hand with cooperation. Membership duties and responsibilities will be appreciated and accepted. Maturity is developed as a trait of the members and usually leads to effective group leadership. A mature person is sensitive to his own needs, the needs of other members and the needs and goals of the group.

Educational benefits derived from group association will depend somewhat on the initiative and participation by the individual. New facts on particular subjects may be found through research for problem solutions. Whenever two or more people get together there may be an exchange of ideas which are useful to all parties involved. Also, the benefit of the knowledge and personal experiences of other people are received which usually cannot be found in books alone.

CONTRIBUTIONS OF AN ORGANIZATION TO ITS COMMUNITY

The number and types of organizations are long and varied, without clear-cut boundaries. Examples of community organizations are Chamber of Commerce, civic, recreational, youth, fraternal, educational and study, religious, hobby, political and governmental, professional and grievance groups. All organizations are developed to fulfill some need. Many times this need is concerned with the community. We will interpret the community to mean all of the surroundings in which the organization finds itself. A school is a miniature community. The service rendered by an organization to the community may be educational, community service - as park beautification - fellowship and citizenship.

The distribution of information and facts on special projects and new concepts can be effectively carried on by groups that are well-organized and dedicated. The encouragement for the use of various public facilities and community improvement programs can be best accomplished by groups.

Organizations are often developed for the explicit purpose of serving their community. Most of this work comes in the form of community service projects. Some of these services are clean-up campaigns, tree planting, development of recreational areas, etc. Most organizations usually include at least one community service project in their program of work for publicity purposes and civic pride.

The air of freedom within groups stimulates the birth of new ideas and participation by all members. Group goals are usually such that they can be achieved by the group and are drawn-up and accepted by the majority. Individual members can feel that they are contributing to the group when cooperation and participation is provided. Participation in planning and decision making is a prerequisite to responsibility. All members can be kept posted on the group progress toward desirable goals. Each member of the group can find ways of satisfying his personal needs for self-expression, prestige, personal achievement, social contacts, and group recognition. Groups can function in an informal atmosphere free from tension and frustration. The groups must learn to believe in goals and accept responsibilities as members.

Businesses are generally group organizations as is a family and both personify the idea of corporate leadership which is the parent surrogate for individual human leadership.

STUDY QUESTIONS

1. How can the basic needs of an individual develop within a group?
2. What contributions does an organization make to its members?
3. What contribution does an organization make to its community?
4. List ten or more organizations in your community.

5 MEETINGS

Good meetings are not an accident, but they must be planned in order to fulfill the needs of the group. All meetings must have a purpose or purposes to be successful. There may be general and specific purposes for meetings. General purposes would include: Fellowship, citizenship, patriotism, and leadership. Specific purposes could be items of business and special features, such as movies, slides, and demonstrations. The heart and soul of all organizations are their interesting and well-conducted meetings.

PLANNING

Good meetings are planned meetings. Planning will result in a challenging program of activities. Participation by all members encourages the development of their leadership abilities. Meetings should be planned and arranged well in advance. Long-range planning will enable the organization to schedule important speakers, secure needed facilities and pinpoint membership responsibilities. Important considerations in conducting meetings are: (1) Officer planning, (2) Order and conduct of business, (3) Paraphernalia and room arrangements, and (4) Attendance.

RESPONSIBILITIES

Officer Responsibilities: The executive committee, which usually consists of the officers and committee chairmen, is responsible for planning each meeting. They should develop the agenda and post the items of business. Officers should know

their parts and be able to lead, but not dominate the meeting. They should also have a knowledge of parliamentary procedure and its working application. Goals and objectives of the organization should be kept in mind at all times.

Members' Responsibilities: Members often have the feeling that they have no responsibilities. Nothing could be further from the truth. They should be familiar with the basic rules of parliamentary procedure. They should also be aware of the items of business and be prepared to discuss and vote on them. Attendance is one of the most important responsibilities that a member needs to practice and develop into a habit.

ROOM ARRANGEMENT

The meeting room atmosphere is dependent upon the room preparation. The chairs should be spaced far enough apart to have freedom of movement, and so that everyone can see and hear the speaker. Adequate ventilation, lighting and heat should be provided. A sentinel or sergeant-of-arms should see that all members and guests are comfortable and that the paraphernalia is in proper order.

PARAPHERNALIA

The proper paraphernalia includes such items as the United States Flag, club banners, officer stations and symbols, a podium and amplifying equipment for groups of 75 or more persons. Chalk boards are generally a part of all meeting rooms. One frequently hears speakers make the statement, "I don't need this loud speaker." Nine times out of ten, he is wrong, as speakers often drop their voice and can only be heard by the use of proper voice amplifying equipment.

ORDER OF BUSINESS

Every organization needs an order of business to be used in planning and conducting a meeting. It should be planned to fit the organization's needs and to establish a good atmosphere. The following order of business has proven beneficial and can

be used in most organizations:

1. Opening ceremony (official ceremonies should always be used when applicable).

   Call to order.

   Roll call of members and guests.

2. Minutes of previous meeting (read by the secretary and approved by the membership).

3. Reports:

   Officers' (Treasurer's at every meeting, others as needed).

   Committee reports by standing regular committees and by special committees (All committee reports should be in writing. After a report has been given, it should be filed with the secretary. Often committee reports are posted for membership information.).

4. Unfinished business.

5. New business.

6. Special feature - speakers, panel reports, and movies.

7. Closing ceremony (when applicable).

8. Recreation or entertainment and refreshments.

TYPES OF MEETINGS

Regular Meetings: All the members participate in regular meetings. They are held monthly or more often, depending on the specific organization. A varied program of business, education and recreation is presented. The methods used are a combination of formal and informal presentations and discussions.

Board of Directors or Executive Meetings: These meetings are generally small, consisting of 5 to 15 members. They generally meet before the regular meeting to make plans and suggestions for the organization.

Committee Meetings: The standing or special committees are small groups containing from 3 to 10 members. How often they meet is variable. They study selected problems intensively, collect facts, prepare reports and recommendations, and carry-out decisions of the organization.

National, Regional, State or District Meetings: These meetings are generally very large, consisting of delegates from local groups or states. They are held annually to consider and vote on resolutions and coordinate activities of larger groups.

Special Meetings: These meetings may have any number of the members present. Their purpose is to conduct items of business which cannot wait for the regular meeting. They may be called at any time by the President.

STUDY QUESTIONS

1. What are the different types of meetings?
2. What is the responsibility of an officer?
3. What is the responsibility of a member?
4. Why is it important to have an Order of Business?

6 ATTENDANCE

The importance of keeping good attendance at meetings cannot be overemphasized. Many organizations have had problems with membership and attendance at meetings. In many cases, the success or failure of these organizations could have been related to attendance.

PROBLEMS OF ATTENDANCE

Although most organizations pursue prospective members, few are concerned with discovering why members lose interest and fail to attend or drop out entirely. There are reasons why a sound policy, concerning drop-outs, is essential to the work of any organization. Members who have dropped out or who no longer attend meetings may many times be persuaded to renew their interests. Knowledge of why people drop out or no longer attend meetings will help in assessing the general condition of the organization, in opening to inspection any reasons for dissatisfaction, and in determining future policy. Sometimes poor attendance means that members have become less active than before; sometimes it means they have lost interest entirely and no longer desire to continue membership. It should be remembered that every organization has some turnover in membership, thus affecting attendance.

SUGGESTIONS FOR ATTENDANCE

Have you ever noticed that some organizations are able to keep a higher percentage of attendance than others, even though the two groups are made-up of the same people? Having high attendance at meetings means more than having common objectives or interests. Promoting of attendance may be accomplished by having (1) dynamic programs, (2) notifying members about meetings, (3) member participation, (4) publicity, and (5) attendance recognition.

Dynamic programs: By having a good program of activities, a leader has insurance of a successful, well-attended meeting. A large turnout is insured if a member feels that something is lost by not attending.

Notify members of meetings: Sometimes attendance is small because members have forgotten the meeting was to be held. Notifying members of each meeting not only serves as a reminder but makes members feel their own importance. Notification could be by any one of the following: Personal letters, mimeographed letters, postcards, telephone calls, radio announcements, personal contacts, and others. Notification should include time, place, and reason for meeting.

Membership participation: The skillful leader will make the members feel wanted and needed. Many times an individual will remain silent because he is afraid others are not interested in the same things he is. The contributions of these individuals are important for the success of a group.

Publicity: People like others to know what they and their organizations are doing. Good publicity leads to prestige. Publicity may include activity reports in newspapers, magazines, radio, television, and newsletters.

Attendance recognition: Some organizations strive for perfect attendance by offering special awards. In some cases people have had perfect attendance for many years and have developed a great deal of self-satisfaction from this record. It should be kept in mind that attendance is something you learn and develop into a habit. Attendance recognition may be in the form of awards, pins, plaques or recognition at banquets. Recognition for continuous membership such as 5, 10, 15, and 20 years' service awards are often used. In some cases, organizations drop members from their roles for missing a certain percentage of meetings. Others use gimmicks such as door prizes, fines, or lunch to encourage attendance.

STUDY QUESTIONS

1. Why is attendance important to the success or failure of an organization?
2. What are some of the factors or conditions which affect attendance?
3. Why is a dynamic program probably the most important contributor to organizations with high attendance?
4. What is the importance of a sound drop-out study?

7 MEETING ROOMS

A meeting room should have certain aids, facilities and equipment to provide an effective atmosphere for successful and enjoyable group meetings. A well-arranged meeting room and a well-equipped room adds dignity and enthusiasm to the organization. Appropriate paraphernalia are a necessary part of all organization meetings.

The room should have ample space in order that business can be conducted with freedom of movement. The room should be equipped with a ventilating fan or windows to keep fresh air in the room. A room often times becomes stuffy and this causes mental fatigue. Lighting should be such that it causes no glare to anyone situated in the room. Also, it should be sufficient enough for clear visibility in all parts of the room.

ROOM EQUIPMENT

The seating arrangement should be orderly and not crowded. The speaker's podium should be at the front of the room and the seating facilities well-spaced and orderly throughout the rest of the floor space. This could be in a half-circle or rows.

The American Flag should be displayed in the room in its proper manner. When used on a speaker's platform, the flag should be displayed above and behind the speaker. If flown from a staff, it should be in the position of honor on the right end of the platform. It should never be used to cover the speaker's desk or to drape over the front of the platform.

Projectors for slides, movies, drawings, etc. should be available. There should be a chalk board at the front of the room, also other aids that are helpful. A public address system should be present at the podium even in a small room, for there are some people who cannot be heard even in this situation.

MEETING PARAPHERNALIA

A podium should be present at the front of the room for the chairman. A gavel should be on the podium for directing meetings. If the organization has a banner, it should be displayed in its proper manner. Some organizations have appropriate symbols and stations for their officers. Emblems create pride in an organization. A manual of parliamentary practice should be available in case that a question arises in parliamentary procedure usage. The responsibility for setting-up the paraphernalia for a meeting usually lies with someone who is elected or appointed to that job.

STUDY QUESTIONS

1. Why is it important to give consideration to selection of a meeting room?
2. What equipment is generally needed for most meetings?
3. How can the assignment of responsibility for the arrangements for the room and equipment best be handled?

8 OFFICERS

Because officers are the backbone of any organization, officer selection is one of the most important duties of an organization. Officers must be well-qualified and enthusiastic in order to lead a challenging program which will benefit the needs of the group. Important considerations on officers are these: (1) Selection, (2) Qualifications, (3) Duties, and (4) Training.

SELECTING OFFICERS

Securing capable officers is a difficult task that requires a great deal of planning. Popularity is too often used to select officers with little or no consideration given to interest, qualifications and time available for the job. There are several different methods of selecting officers. The two most frequently used methods of selecting officers are (1) the nomination committee and (2) nomination from the floor. The nominating committee is usually made-up of past officers, the advisor or advisory committee. Their duty is to review all applications and interview the officer candidates. They present a slate of the candidates they feel are best qualified. Nomination from the floor consists of individual members nominating the candidate of their choice. Appropriate speeches for candidates are popular with youth groups as well as at large conventions. Some groups have no nominations from the floor.

OFFICER QUALIFICATIONS

In selecting officers there are several basic qualities that must be kept in mind. They are: Desire and willingness to work, enthusiasm, ability to learn correct

procedure, ability to express oneself, ability to get along with others, self-confidence, humility, ability to lead, and adequate time to perform the duties of the office. Different offices require different abilities.

OFFICERS REQUIRED

Every organization has a required amount of officers which they must elect. The four common officers of an organization are President, Vice President, Secretary, and Treasurer. There are several other offices that may be added if the organization finds an interest and a need. They are: Reporter, Sentinel, Historian, Parliamentarian, Song Leader, Recreation Leader, Chaplain and Student Advisor. In large organizations it is a common practice to have assistant officers to help carry-out the work of the office. Junior officers or class officers are also used to provide training for potential leaders in becoming better prepared for assuming responsibility as a regular officer.

ELECTIONS

The time for officer elections will vary with each organization, depending on when they complete their year. In school organizations it is best to have the elections in the spring. This will give the newly elected officers time to adjust to their responsibility and become fully acquainted with their duties before school is out. They will then be prepared to start off with an active program when school starts. The time of the election meeting and the date of the meeting should be established so every member can be present if possible.

Nominations should be posted at least a week previous to election. This will give the members an opportunity to study the candidates and vote intelligently. Voting by secret ballot is the best method of voting. This assures that a member votes by his own choice and not to "go along with the gang." It is up to the organization to decide what type of vote will be required for a candidate to win.

Organizations may find it desirable to close nominations and elect one officer at a time. This permits the members that lost to be nominated for another office. If only one person is nominated for an office, a motion can be presented to elect the person by acclamation.

INSTALLATION

Officers should be installed at the first regular meeting following elections. It is advisable to invite guests and parents, when appropriate, to this meeting in order that they may better understand the responsibilities involved in an office and may be able to provide assistance and guidance when needed. This should be an impressive formal meeting and a charge can effectively be given to the newly elected officers by the advisor or adult leader in care of youth groups.

DUTIES

All officers have definite roles which they must abide by to be successful in their position. Besides these specific roles, there are general roles which apply to all. Some of these are: Attend meetings regularly and take an active part, keeping informed, being ready to represent your organization at all occasions, cooperating with members and other officers, and keeping in touch with the advisor or advisory group.

Duties as President: See that the meeting place is acquired and adequately prepared, plan the meetings with an executive committee, and take charge of the meeting to see that it is conducted in an orderly manner. Know the order of business, constitution and by-laws, and parliamentary procedure. Keep the meeting moving and appoint committees and serve as ex-officio members. Be fair and just in decisions, call special meetings when needed and do not give your own opinions.

Duties as Vice President: Learn the duties of the president, be able to take over these duties in the absence of the president, serve as chairman of committees, and be able to express himself well before meetings.

Duties of Secretary: Keep records for the organization, keep minutes of all meetings and handle the correspondence. Preside over meeting in absence of president and vice president, have an order of business available at each meeting and check the roll of attendance.

Duties as Treasurer: Present ways of raising money, receive money and give a financial report at each meeting. Pay bills promptly, keep accurate records and accounts and assist in preparing a budget.

Duties of Parliamentarian: Assist the president when needed in the orderly conduct of business, have a working knowledge of parliamentary procedure and have reference to Roberts Rules of Order. Call attention to serious errors in parliamentary procedure and give advice to the president on parliamentary matters but leave the decision to the president.

Duties of Sergeant-at-Arms, Sentinel or Usher: Set-up the meeting room and care for paraphernalia and equipment. Welcome guests, make the room comfortable, take charge of candidates for initiation ceremonies and assist with entertainment features and refreshments.

STUDY QUESTIONS

1. Why is it important to have good officers?
2. What are some procedures in selecting officers?
3. How should officers be voted upon?
4. When should officer elections be held?
5. What method is best for electing officers?

9 LEADERSHIP TRAINING SCHOOLS

The primary purpose of leadership training schools is to make individuals and groups aware of the processes of leadership. Such schools are designed to develop skills in public speaking, parliamentary procedure, conduct of meetings and evaluation through practice and classwork. Leadership schools stress the duties of the officers, committee chairman and members as well as their responsibilities to the group. The advisors or training school directors plan the curriculum or agenda for the leadership training school.

TYPES OF LEADERSHIP TRAINING SCHOOLS

There are many types of leadership schools available to members of organizations and individuals. The more common leadership schools are leadership camps or one-day conferences. Contrasted to a camp or conference type program would be that of an in-school course or portion of a course on leadership per se. Each of the programs could make their unique contribution to individual and group leadership education.

Leadership Training Camps: The leadership camp is where members learn the different types of leadership by taking part in the activities of the camp. Most camps have periods where groups will hold panel discussions on a particular phase of leadership. Group discussions may also be held on ways to improve leadership in their organization. Class study in parliamentary procedure and actual practice in conducting meetings, using correct parliamentary procedure, are valuable procedures used in training schools. Recreation is an important feature of camp programs.

Day or Evening Conferences: The day conferences are ones where resource people are used to teach members good leadership. This can be done by panel discussions, symposiums, and lectures. The duties of officers and committee chairmen are given

major stress at one type of leadership conference. Time is set aside for special instruction for each officer. The duties and responsibilities of each officer are covered in detail.

ATTENDANCE AT A LEADERSHIP SCHOOL

A member or officer attending a leadership training school should have the purpose of the school definitely in mind before the school starts. A program of the material to be covered at the school should be studied and notes made of the most important phases the member feels he would like to learn. If the attendant is a member of an organization, he or she should have the history and the purposes of the organization well in mind. A familiarity of the constitution, by-laws and program of work attained before attending a leadership school is very desirable.

Classroom Instruction: As more text materials become available stressing both individual and group activities, leadership can become a fruitful classroom course. Leadership education is more than a study of officer duties and parliamentary procedure. Leadership education in the past has been achieved largely through experience rather than a combination of experience and study. Many outstanding books and periodicals are devoted to leadership. Classroom efforts in leadership education can stress the development of abilities and understandings on the part of each individual person. This concept of individual personal development is in reality the major function of our elementary and secondary schools and of leadership courses and training. Special courses on leadership are subjects of study in colleges and in universities.

Individual classroom education in leadership can stress knowledge of (1) speaking, (2) reading, (3) listening, (4) parliamentary practice, (5) meetings, (6) committees, (7) programs of work, and (8) objectives and evaluations and many other facets of individual and group leadership.

LEADERSHIP EDUCATION

Leadership education can be studied to depth. Communications between individuals and groups is a broad subject. Items discussed here for possible leadership school subjects are (1) officers' duties, (2) programs of work, and (3) individual membership skills.

OFFICERS' DUTIES

Most leadership camps and one-day conferences stress officers' duties. These duties are generally stated in detail in organization, club manuals. Officer training can be important to the success of an organization but a broader concept of the total organization involving the total membership is desirable.

President: One of the most important duties of the president would be to know the correct procedure in conducting a meeting. He should have a working knowledge of parliamentary procedure. He must be responsible for the adjenda of a meeting and have a knowledge of the constitution and by-laws.

Vice President: The duties of the president should not over-shadow those of the vice president. The vice president needs to know the duties of the president for he will take over in the absence of the president. The vice president also has charge of all committee work.

Secretary: It is the duty of the secretary to prepare the minutes and adjenda of a meeting. He must write all organizational records and count and record votes. It would be suggested that the secretary have the following items with him at all meetings: Secretary's book and minutes, constitution and by-laws of the organization, list of all committees, both standing and special.

Treasurer: The treasurer shall pay all bills and collect all moneys of the organization. He prepares an accurate financial statement and gives a report at each meeting. It is suggested that the treasurer prepare a budget of all income and expenses.

Reporter: The main duty of the reporter is to keep the public informed on the local, state and national levels of the activities of the organization. He should also keep a scrapbook or permanent record of all activities during the year.

Parliamentarian: The parliamentarian serves as an advisor to the president on procedural matters. The parliamentarian gives the decision, however the president makes the ruling.

Sergeant-at-Arms: He may be called a sentinel or tiler also. This person is an important auxiliary officer of many organizations. He may introduce guests, check on those seeking admittance, prepare the meeting room and at times makes provisions for refreshments.

PROGRAM OF WORK

The meat of any organization is its program of work. This refers to a plan of activities the group will carry-on during the year. A suggested practice would be to have each member as an active participant in one or more activities. Items that would fall under this heading would be:

Finance - The program of work should give in general all the activities that will pertain to finance.

Service - Included under this heading would be all activities that are connected with service to the individual, state, community and nation.

Relations - Any activities that are related to the public or the group.

Conduct of meeting - Actual practice by members in carrying-on a meeting.

Leadership or citizenship - Practice in giving talks and reports. Also the responsibilities of members and organizations to the community and nation.

Recreation - All functions that the group participates in which are recreational in nature.

DEVELOPMENT OF SKILLS

Each leader needs to develop leadership skills. Many of these skills will be stressed during the leadership training school. Some of the skills that could be introduced are:

Speaking - This can be done through panel discussions, reports, symposiums, and writing reports.

Reporting of Committee - It is accepted practice to choose a member of the committee to record the proceedings of a committee meeting. This member then would submit this report to the regular meeting. This policy should be practiced for recording the proceedings or business.

Reporting on Conventions, Trips or Special Functions - This type of report should not be a chronological report such as boarding the train at 3:15, leaving at 4:20, etc. It should be concise yet long enough to explain the event. Special events or main topics should be noted. In some cases, acknowledgements for the trip should be included at this time.

Parliamentary procedure - This may include learning terms, kinds of motions and practice running a meeting.

Others - Such things as reporting meeting activities, developing personal traits and the use of group dynamics are skills which are important kinds of training given at leadership conferences.

STUDY QUESTIONS

1. Who should attend a leadership training school?
2. What are the types of leadership training schools?
3. Give the duties of the president.
4. What skills can be brought out at a school of this type?
5. Explain the purpose of the program of work.
6. How does the training take place?

10 GROUP DYNAMICS

Group dynamics is a term applied to methods and processes used to communicate ideas between groups and individuals within groups. Well-known group dynamics processes include use of panels, role playing, brainstorming and "buzz" sessions.

"Group dynamics" is the perpetuating of interactions within a group. The success of groups depends on individual abilities and skills of the leaders to perpetuate group interactions. Groups are formed to perform a specific function. Group dynamics encompasses any size of gathering. This may include the public at large but specifically groups of people. Consciencious leaders are interested in how they can best involve members and to create action. An understanding of the various facets of group dynamics is the first major step in creating democratic action for problem-solving purposes.

THE CRITERIA OF GROUP SUCCESS

Growth means the process through which an immature organism reaches maturity. Knowing the quality factors of the organism or the group, knowing the strength of the environment and the complexity of the task, we may then predict its growth - or in the case of an organization, its success. We must be tolerant, or in other words receptive to all viewpoints, be active, responsible contributors, not be class or status conscious, be oriented towards reality, be seeking the facts, maintain a friendly atmosphere, have objectives that are of group interest and make every

effort to carry-out the groups' decisions. These group qualities are the qualities of an ideally democratic system. This indicates that having an ideally democratic system of group actions would insure success if the reasons for having the group or organization were real and challenging.

PRINCIPLES AFFECTING THE DEGREE OF SUCCESS

Success is a broad term. What appears to be a success to one group may be a failure to another group. But regardless of to what degree of success we strive, there are certain principles that affect the degree of this success. The problem must be real and not a doing, just to be doing, activity. The leadership should be team leadership with each individual woven into his area of leadership responsibility. The membership of action groups should be based upon willingness to work. Dead weight in a group has a detrimental affect on the remaining members. The amount of participation will depend on the gratification derived from accomplishments. The group should determine its own self-government. The decisions should be subject to revision based upon the action taken.

WHY GROUPS FAIL

To be successful we must understand why groups fail. To recognize the general causes of failure is the basic step toward group success. In many groups that have failed the following reasons were probably contributing factors: A democratic atmosphere had not been developed. The wrong group of people were combined to form the group. The group may have had too wide an area of interests and too narrow an area of skills and abilities. The group may have lacked the knowledge and skill to carry-out the objectives of the group. The organization may not be so designed to solve the problems that were failures. The "problems for action" must be of total interest to the group and not of specific interest to individuals. Individualism cannot be a characteristic of a prospectively active and successful group.

STEPS IN PROBLEM SOLVING

Whether or not an individual or group makes progress largely depends on the steps followed to solve a problem. When action is needed the group must see the need and develop the challenge within their minds. When this personal challenge has developed, the group must formulate and state a set of acceptable objectives or philosophies. The group must define the problem or problems and place them in their order of priority. The group must examine the suggestions for all possible solutions and select the most probable alternative of these solutions. To do this they must (1) collect and classify the pertinent data, (2) critically evaluate each proposed solution, and (3) decide upon the course of action. When the course ofaction has been decided upon, it would be most beneficial to integrate the activities of person and agencies capable of working upon the solution.

HOW TO GET PARTICIPATION

The heart of group dynamics is participation. Problems of groups can normally be quite easily solved if all members would take an active part in searching for the solution. Many individuals do not participate because the goal seems unimportant, they may have a fear of the solution, they may think that the group lacks the skill to solve the problem. They may feel that their work may be useless or they may be involved in a personal conflict with the general attitude or solution prescribed by the group. To obtain high-quality participation, leaders must be sure that the members help design their own plans. Plans should develop out of members' needs and wants. These plans must be based on true facts and not fantacies. Proficient leadership will stimulate participation. No group can be expected to materialize into anything beyond the ability and sincerity of its leadership.

DEVICES EFFECTIVE IN STIMULATING GROUP PARTICIPATION

The interest approach is probably the most important device available to promote participation. All groups can be encouraged to demand a solution and to strive for that solution if they truly see the need, purposes and objectives of their challenging endeavor.

To explore the problems and to discover the interests and attitudes of groups, a leader could use the quiz method to draw-out this information. Particular and professional care must be taken in developing these questions so that they truly express the information that is needed.

Some individuals may like to use the questionnaire method to obtain the topics necessary for discussion.

A forum or symposium which consists of several speakers that present different aspects of the problem and having their presentation followed by questions from the audience is usually a very effective method. It is particularly effective if the speakers are able to reach each member of the group with challenging thoughts.

A panel is quite effective in opening up the audience because of its informal approach to a problem.

A hearing with a judge and a jury listening to witnesses who give testimony on both sides of the question may be aimed at discovering the important problems, giving facts and evaluating the proposals.

Some particular problems can sometimes be best approached by providing a clinic where experts hear the case and they prescribe the remedy or treatment to the problem at hand.

This clinic system can be easily converted to an interview approach to finding a solution to a problem. These experts are brought together for interview by selected group members. This often brings about participation of a greater number of people than does the clinic system.

If the problem involves personal or emotional problems a private interview and play-back may be used to overcome shyness or personal objections to group exposure of personalities.

The most effective method of developing ideas is to use the system called buzz sessions. Groups are divided into smaller groups of 6 to 8 persons. These groups are asked to discuss definite questions and to report their selected answer within a given time. Many individuals unwilling to speak before larger groups will often take an active part in small group discussions.

Some groups may use observers that mingle with the groups to listen for problem discussions that are being carried-out during recesses or coffee hours. These problems may be group problems that deserve group action.

Brainstorming is a system used in a small group. This system encourages anyone to speak-up with what comes to mind, irregardless of practicability or consequences of the statement. This system must be carried out informally. It tends to reduce the chance of overlooking some possible answers to the problems at hand. Ideas are generally written on the chalkboard.

Dramatization of a problem by role playing may motivate a group into action. The role players try to enact the conditions that would exist if no action were taken on the problem or if particular action is taken.

Professional groups often use workshops, conferences, or institutes to discuss and obtain information about specific problems or solutions to problems.

Any one of these devices can be very effectively used in an organization to determine the problems that need action or to provide information on the solutions to specific problems. Promoting group action in a democratic fashion is group dynamics.

STUDY QUESTIONS

1. For what reasons do groups fail?
2. In what way does atmosphere affect a group?
3. How can we improve atmosphere?
4. How can you as an individual help make an activity a success?
5. How can you as an individual help make an organization successful?
6. For what reasons do some individuals fail to participate in an organization?
7. What are some of the devices that would be most effective in bringing about participation?
8. What are some of the devices that could be used to draw-out problems or ideas for action?

11 PARLIAMENTARY PRACTICE

A system whereby people can arrive at group decisions is made possible through a media known as parliamentary practice. Correct parliamentary practice or procedure is most effectively learned through practice in real-life situations. Parliamentary procedure is an orderly means of transacting business which allows majority to rule but the minority is heard. It accomplishes items of business in the least time and is the accepted form for transacting business of all formal groups.

Perhaps the secret of using parliamentary procedure successfully is that of simplification. Leaders need to follow a set of rules when conducting a meeting, but they need not be complicated.

Parliamentary procedure can be relatively simple and should be used according to the ability of the group. Everyone has the ability to learn parliamentary procedure. People desire "democratic action" and parliamentary procedure is democracy in action. Many groups and individuals have little knowledge of parliamentary procedure and do not follow the accepted form. Parliamentary procedure is aimed at fairness to all and getting most done in least possible time. Actural doing or practice is one of the better ways of learning parliamentary procedure.

Many groups tend to place too great an emphasis on correct parliamentary procedure. The only real purpose of parliamentary procedure is to "get done what needs to be done." Any group could select one of several references like Roberts' Rules of Order to serve as their guide. In an article in the Adult Leadership Magazine entitled "Move Over Mr. Roberts," Malcolm Knowles suggests that Roberts' Rules of Order have for too long a time dominated group meetings.

Suggested means of learning and teaching -- Teach a unit of parliamentary procedure in class; use film strips on parliamentary procedure; use demonstrations; use drill or practice; use correct parliamentary procedure at all meetings and use parliamentary procedure in contests.

BASIC PARLIAMENTARY PRACTICES

Steps in presenting business -- When motions are presented, it is necessary to complete the following steps.

(1) Obtaining the floor -- Member rises and addresses the president: "Mr. President," "Mr. Chairman" (or "Madam Chairman") - in large assemblies give name and representation.

(2) Assign the floor or recognition -- President recognizes the member by stating his name. This helps to establish order - "Mr. Jones has the floor."

(3) Stating business -- Correctly stated motions: I move that . . ." Avoid saying, "I make a motion that . . ." or "I so move . . ." The last two statements are not according to accepted parliamentary procedure.

(4) Second by another member -- "I second the motion." To second a motion, a member need not rise unless in a large assembled group. Chairman may also call for a second: "Do I hear a second to the motion?" If motion requiring a second does not receive one, the motion is lost.

(5) Statement of question -- After a motion has been made and seconded, the president then restates the motion before the group. "It has been moved and seconded that . . ." Restating the motion keeps the group informed.

(6) Presenting the motion for discussion -- Motions made and seconded are open for discussion. "Is there any discussion?"

(7) Voting on the question -- When debate is ended, the presiding officer should rise and ask, "Are you ready for the question?" Or, if no member wishes

to discuss question further, chairman can proceed to vote. "All those in favor of motion that we buy a tractor say, 'Aye' - those opposed say, 'No.'" If a member wishes to stop debate on a motion, he moves the previous question, "I move the previous question." Vote is taken on stopping debate. If this passes, then group votes on main motion.

(8) Announce decision-- Simple method - "Motion passed" or Motion lost." This keeps the group informed; at this time it is also very effective to tap the gavel.

Making Ammendments-- The person having the floor may wish to modify the original motion. This can be done by adding words, by striking out and inserting words, or by substituting. Amendments can be made only to the second degree (an amendment to an amendment to a motion). The third degree is not allowed since it adds to confusion. Often a main motion is made and seconded or during discussion, a member wishes to amend a motion. He addresses the chair, is recognized and given the floor. "Mr. Chairman, I wish to amend the main motion to read that the picnic be held at 8 p.m. (He adds to the motion "that we have a picnic.").

Chairman - "Do I hear a second?"

Floor Member - "Second."

Chairman - "Any discussion?"

Floor Group - "Question."

Chairman - "All those in favor 'that we hold a picnic at 8 p.m.' say, 'Aye.'

Opposed, 'No.' Amendment is passed."

Now act on the original motion.

KINDS OF MOTIONS

Main Motions or Principle Motions-- These motions bring business before a group. Example: "I move we send two delegates to the leadership school." Main motions yield to subsidiary, privileged, and incidental motions, are debatable and amendable.

Subsidiary Motions-- Subsidiary motions are motions that modify or dispose of a main motion. These motions must be decided before the main motion can be brought to a vote. Subsidiary motions in order of importance are:

(1) Lay on the table - lays aside business for more pertinent matters.

(2) Call for the previous question - stops debate.

(3) To limit or extend debate - sets time limit on debate.

(4) To postpone - lays aside business to specified date.

(5) To commit or refer - places business in hands of a few.

(6) To amend - changes or adds to a motion.

(7) To postpone indefinitely - kills action.

Incidental Motions-- Incidental motions are ones that arise from a pending question. They may, therefore, come-up at any time. Incidental motions must be decided on before the question they are incidental to. Incidental motions yield to privileged motions. Some of the most common incidental motions are:

(1) Point of order - corrects mistakes or disorder.

(2) Appeal from decision of chair - group asks chair opinion.

(3) Suspend rules - allows variation from order of business.

(4) Division of house - calls for accurate check on vote.

(5) Nominations - to close - requires a 2/3 vote - no debate.

(6) Nominations - to open - majority vote required.

(7) Parliamentary inquiry - asks questions of parliamentary procedure.

(8) Withdraw a motion - prevents action on motion.

Privileged Motions-- Privileged motions have the highest order or rank and are motions that affect the convenience of the group or one of its members. These motions do not refer to the pending question. Examples are not debatable:

(1) To fix time at which to adjourn - sets the time of adjournment.

(2) To adjourn - closes meeting.

(3) To take a recess - allows for freedom of smaller groups during a session without adjournment.

(4) To raise a question of privilege - concerns the health and well-being of the members.

(5) To call for orders of day - order which the assembly has decided to do business.

Unclassified Motions-- (cannot be readily classified)

(1) To take from the table - opens discussion on business put aside.

(2) To reconsider - means whereby a decision once made and later seems wrong can be changed.

(3) To rescind - to nullify action.

(4) To ratify - confirms.

Resolution-- Often wishes of a group are written-up in the form of a resolution to be presented to executive committee so it can receive action.

Use of Gavel-- The gavel has certain traditional uses which every chairman should understand. It is a symbol of authority to be used with discretion by the chairman. The following taps mean: one tap - to sit, adjourn, announce completion of item of business; two taps - calls meeting to order; and three taps - members are to rise.

Parliamentarian -- (if used) The parliamentarian of a group serves as advisor to the president on procedural matters. The parliamentarian advises the chairman; the chairman or president, however, gives the ruling.

SUMMARY OF MOTIONS*

(Adapted from Robert's Rules of Order)

Kind of Motion	Second Required	Debatable	Amendable	Vote Required	Purpose
Privileged Motions					
Adjourn	Yes	No	No	Majority	To end the meeting.
Take a Recess	Yes	No	Yes	Majority	To interrupt a meeting for a short time or provide an intermission.
Raise a Question or Privilege	No	No	No	None	To obtain action immediately in an emergency.
Subsidiary Motions					
Lay on the Table	Yes	No	No	Majority	To set aside an item of business temporarily.
Previous Question	Yes	No	No	Majority	To close debate immediately.
Postpone to a Certain Time	Yes	Yes	Yes	Majority	To delay action.
Refer to a Committee	Yes	Yes	Yes	Majority	To place business in hands of a committee.
Amend	Yes	Yes	Yes	Majority	To modify or alter a motion.
Postpone Indefinitely	Yes	Yes	No	Majortiy	To kill a motion without bringing it to a vote.
The Main Motion					
Main Motion	Yes	Yes	Yes	Majority	To introduce new business

*Highest ranking motions are at the top of the list. While any motion is pending the motions above are in order and the ones below are out of order. While this list is not complete it does contain those motions which members should understand and possess some skill in handling. For a complete list see Roberts' Rules of Order.

Kind of Motion	Second Required	Debatable	Amendable	Vote Required	Purpose
<u>Incidental Motions</u> Nonranking					
Point of Order	No	No	No	None	To enforce the rules of the organization.
Appeal from the Decision	Yes	No	No	Majority	To insure that a majority of the group agrees with the ruling of the chairman.
Suspension of the Rules	Yes	No	No	Two-thirds	To facilitate business ordinarily against the rules of the organization.
Division of the Assembly	No	No	No	None	To secure a counted vote.
To Close Nominations	Yes	No	Yes	Two-thirds	To limit number of nominees.
Parliamentary Inquiry	No	No	No	None	To provide members with correct parliamentary information.
Request for Information	No	No	No	None	To answer questions of members.
To Withdraw a Motion	No	No	No	None*	To withdraw a motion before it is voted on.
<u>Unclassified Motions</u>					
Take a Motion from the Table	Yes	No	No	Majority	To bring before the group a motion previously tabled.
Reconsider	Yes	Yes**	No	Majority	To secure a new vote on a motion previously voted on.
Rescind-Repeal	Yes	Yes	Yes	2/3 without previous notice	To void previous action of the organization.

**Yes, if motion to be reconsidered is debatable.

STUDY QUESTIONS

1. What is the purpose of parliamentary procedure?
2. Give the steps in procedure of passing a motion.
3. In transacting business, which is voted on first - the motion or the amendment?
4. List the classification of motions.
5. What are subsidiary, incidental and privileged motions?
6. What would you do if two members wished to gain the floor at the same time?
7. What is the purpose of tabled motions?
8. How can a member stop debate?
9. What is the purpose of amending a motion?
10. What is the difference between tabling and postponing?
11. Give the purpose for rising to a point of order.
12. How does a group go about getting an opinion from the chair?
13. How does a parliamentary group leave-out part of the order of business?
14. How are nominations made and need they be seconded?
15. What is a question of privilege?
16. For how long are motions tabled? When must they be taken from the table?
17. What is the signal by gavel for members to rise?

12 PROGRAM OF WORK

A program of work is the same as a calendar of events. It may be defined as "an outline of activities" or "a plan of action" covering a definite period of time, usually one year. Most, if not all, organizations need a program of work, or at least some type of plan for group activities, if they are to accomplish the goals set by the members. A program of work is the backbone of any organization and gives an organization a plan so they can carry out their activities efficiently, timely, and systematically.

SUGGESTIONS FOR SETTING-UP GROUP ACTIVITIES

A good program of work includes a specific set of goals and a definite plan on how these goals are to be reached. It should also be well planned and carefully weighed and meet the needs of the group. The goals should be set high enough so you have something to strive for but within reach of the organization if they are determined.

Major areas to be included in a well-planned program of work may be any part or all of the following:

Financing Group Activities
Service (Community, State & Nation)
Relationships (Public & Group)
Cooperative Activities
Meetings
Leadership-Citizenship
Recreation or Fellowship
Individual & Group Welfare

COMMITTEES

A program of work needs various committees that are well informed and sincerely concerned with the welfare of the organization. The chairman should try to include every member on one of the committees. In this way, members will develop a sense of belonging and learn the operation of the organization. One standing

committee should be appointed for each major area of the program, and it may be desirable to have various special committees for some of the more important activities planned under each area of the program. It would be desirable to rotate committees each year so that members get a broader knowledge of the organization. The committees should be expected to give oral reports periodically at meetings, as well as hand in a written report which would become part of the organization records.

These committees could be elected by the group, but in most cases it may be more desirable to have the committees selected by the president or executive committee. When selecting members for a committee, one should keep in mind the interests and capabilities of each member.

DIVISIONS OF PROGRAM ACTIVITIES

Each major division of the program of work should include:

Objectives of each division.
List of committee members and chairman.
List of activities to be carried out.
All goals should be listed for each area.
Each activity should have a plan or ways and means of carrying-out each activity.
Recording of accomplishments.

Examples of formats:

Financing Group Activities

Objectives: To raise enough revenue to adequately finance all organizational activities.

Committee: Chairman - Joe Jones, Bill Smith, Jack Doe.

Activity	Goals	Ways & Means	Accomplished
Sponsor a teenage rodeo.	Raise at least $500 for Club treasury.	1) Advanced ticket sales. 2) Give prize money to top riders. 3) Send winners to State rodeo.	

Calendar of Events for July

Day	Activity	Committee
1		
2	July meeting at City Hall, 8:00 p.m.	
3		
4	4th of July Picnic	Chairman: Joe Jones, Bill Smith, Jack Doe.

STUDY QUESTIONS

1. What is a program of work?
2. List several items that should be considered in formulating a program of work.
3. What is the purpose of a plan of group activities?
4. List several major areas that should be included in a calendar of events.
5. What committees are needed for a program of work?

13 COMMITTEES

The committee is the work horse of an organization. The committee meeting is the ultimate in the expression of the democratic process where individuals meet as equals and strive to reach a common decision or solve a problem for the benefit of all. It is essential that we develop an understanding of the leadership qualities and personal traits needed for effective committee work. A committee is a miniature organization.

Described as the force that makes things go for an organization, the committee may be thought of as a starting point in developing leadership. A committee where many members make no contributions should be avoided. These committees can best be described as a group of do-nothing individuals who meet as a group and make no decisions. The success of the committee can best be measured by how well it serves the parent organization and how well it serves the members of the committee. Small groups through the process of informal thinking and talking things over, accomplish what a large group cannot. This participation tends to develop the individual's speaking ability and other leadership traits. A committee tends to weld individuals into a group. It can also foster the feeling of belonging and encourages the individual to be a participator. A committee can best handle hard jobs that lead to a doing activity. The committee may stimulate action by the organization in carrying-out the organization's goals. The committee must serve its members and its members must serve it.

SELECTING COMMITTEE MEMBERS

Committees are usually appointed by the organization's president, but - in some cases - they may be elected by the group. In organizations where committees are needed for a special function and all members are well-known to each other, the popular choice may add prestige to the group. In large organizations where individuals have a wide variety of interests and abilities, the organization chairman may appoint the committee chairman and allow the chairman to select his committee. The organization chairman must avoid personality conflicts within the committee. This may require him to check with the potential committee members before announcing the appointments. A few simple rules will aid the president in selection of a committee: Select for a cross-section of interests; for a cross-section of status; for a cross-section of seniority; for geographic distribution; members that have an interest in the particular work of the committee; for known abilities and talents within the group.

SIZE

The committee should be small enough for effective work yet large enough that the individual work load is not burdensome; small enough for ready communication but large enough to represent the parent organization. There may be some advantages to an uneven number; 3-5-7 members are frequently used, but the committee may be effective with larger groups of 15-17. Remember, the larger the committee, the greater the need for skill in handling.

COMMITTEE ACTION

The work of the committee will depend largely on the skill of the leader in group dynamics. The meetings may be simply the leader giving information to the group, or they may be non-specific where the members are free to agree on the work of the committee. These two extremes imply a great difference in the degree of member

participation. Most committees will function somewhere between these extremes and often the individual will function all the way from a listener to a participating speaker. To function effectively, the committee must evaluate its accomplishments. The committee should use an accepted form for reporting. The committee may be a permanent committee that functions all year or a special committee that functions for the accomplishment of a single objective. The number of meetings will depend on the needs of the committee. Quarterly or monthly meetings should be considered a minimum.

THE CHAIRMAN

The committee chairman is responsible to see that the room is properly heated, lighted and ventilated. He should be aware of the number of chairs needed and the facilities desired for the transaction of business (paper and pencils may be needed). The chairman should notify members of time and place of meeting. Formal meetings should be held in a public building to avoid obligations. Informal meetings may be held in the living room of some member's home. In informal meetings, the chairman need not be concerned with such things as heat and light. The chairman should help the committee members to understand the objectives. He must become one of the group and remain one of the group if the true democratic process is to prevail. He must guide the group to a decision so the members have a feeling of accomplishment.

MEMBERS

Each member of the committee should give the group the benefit of any special talents or skills he may possess. The success of any committee will depend on the degree of leadership qualities developed within the individuals of the group. Each member should make an effort to develop these individual leadership traits and in so doing help the committee to develop group leadership traits. Informal leadership is the

force that rises within a group that determines the action. Persons who develop these qualities will be persons of influence. Members should avoid monopolizing the conversation; listen and respect the opinions of others; avoid personal prejudices; and strive for achievement of purpose. All members should participate but some members may serve in special capacities. All committees should have a chairman and a recorder. Some committees may need a vice-chairman and possibly a parliamentarian.

SUMMARY

Objectives should be clearly understood and within the authority of the group to make the decision that results in action. Goals should be set that are easily understood by all members. Aim for positive decisions. Summarize the results. Report all activities and accomplishments to the parent organization. Evaluate in terms of leadership objectives.

STUDY QUESTIONS

1. What type of meeting best represents the democratic process?
2. Who determines the need for a committee?
3. What special committee members are needed?
4. How can leadership be developed by committees?
5. How can a committee be organized?
6. What leadership traits are needed by members?

14 RECRUITMENT

The life blood of any organization is an adequate and meaningful membership. Too often new members are recruited and then left to sink or swim. Finding good membership material is very important, however, the induction and training of new members is also very important. Unless new members are made to feel wanted and are kept active, the whole job of recruitment may be lost.

Many organizations die for the lack of membership. How do we get members? Everything an organization does directly or indirectly influences potential members, such as, news reports, items of membership interest, dues, public meetings, endorsement of civic projects, etc. It must be kept in mind that as recruitment is taking place, there is an optimum number of people needed for maximum effectiveness.

MEMBERSHIP RECRUITMENT

Here are some considerations that should be kept in mind:

* Are the organization's goals and aims clear?
* Do the community and prospective members know the organization's goals?
* Is there a conflict between the policy of the membership committee and the policy of the organization?
* Is there an organized method of recruitment?
* Is quality or quantity most important in recruiting members?

WHAT KIND OF RECRUITS DO YOU WANT?

The answer to this question would depend upon the type of organization. For example, a 4-H Club would solicit boys and girls from the ages of 9-21 who were interested in agriculture and home-making. A P.T.A. would be looking for parents and teachers or persons interested in school welfare. The quality of members should be kept in mind. Quality, not quantity, determines a group's success. Heterogenous groups tend to be more successful than homogenous groups.

WHERE FOUND

Prospective members can be found in about every community. These people or prospective members may be in the community, but the programs, goals, and achievements of the organizations must reach them. They have to be informed before the desire to join is initiated.

CONTACTING NEW MEMBERS

There are many ways of contacting prospective members. A close friend or a member with the same interests might make personal contact with the prospective member. The use of membership committees will also be advantageous. An analogous situation of a membership committee might be a complete recruitment department and personnel solely for the purpose of recruitment.

RECRUITMENT PROCEDURES

Here are suggestions for recruitment of new members. Many of the following can be used by many organizations. By no means is the list complete.

Personal Letters: A letter to the prospective member should include an expressed invitation from the organization. Items that might also be included would be aims, purposes, and what may be gained from joining.

Personal Contact: This may be a follow-up from a form letter. This is a desired method when using a form letter. Personal contact should be by a close friend or member having similar interests. Many times an individual is able to explain the goals and purposes and what he had gained as a member.

Orientation Meeting: This may or may not be a regular business meeting; however, the purpose is to inform the prospective member of the organization. A panel, or question and answer period of old and new members might be very effective.

News Reports: The purpose of the news report is to inform the public of the aims, purposes and accomplishments of the organization as well as explain the need for new members. This may be done via television, radio and newspaper.

Banquets: A banquet provides a medium whereby special speakers or officers can outline outstanding achievements of the organization. Prospective members could be introduced as guests.

Social Functions: This type of recruitment is the informal type whereby recreation or entertainment may be the central topic.

Use of Membership Committees: The membership committee should have the primary responsibility for recruiting, orienting and keeping members. It should be the membership committee's duty to:

1. Organize recruitment
2. Prepare materials for distribution to potential members
3. Orient new members
4. Work with the executive board

It should be noted this is usually the most successful method of recruitment.

HOW CAN ORGANIZATIONS KEEP MEMBERS INTERESTED?

In order for a person to continue as a member it is of utmost importance to keep the member PARTICIPATING. Every member should be delegated responsibility and

recognized when completing the job. An active participating member will not have to be re-recruited.

STUDY QUESTIONS

1. Where can members be found?
2. What are some procedures for recruiting members?
3. How could an orientation meeting recruit members?
4. What is the job of the membership committee?
5. When should members be recruited?

15 CITIZENSHIP AS LEADERSHIP

Leadership education is designed to imporve citizenship. Citizenship embraces many phases of an individual's relationship to his community, state and nation. It encompasses the dignity of the individual on one hand and our national heritage on the other.

INDIVIDUAL CITIZENSHIP

Citizenship begins with the individual. The personal traits of leadership are also the traits associated with citizenship. Such traits as loyalty, respect, fair-play, courage, integrity, honesty and determination are essential to the individual if fulfillment of citizenship obligations are to be realized. These traits are developed by participation at all levels and in all kinds of activities. The give-and-take of participation is probably the one thing that contributes most to the development of good citizenship.

FAMILY CITIZENSHIP

Being a member of any group incurs responsibilities as well as privileges. Privileges such as the family car or the family camper carry with it the responsibility of protecting the property and keeping it available for other members of the family. The family is the basic unit of our civilization and culture.

COMMUNITY CITIZENSHIP

Community citizenship includes school citizenship and also organizational citizenship. As a member of this larger group, an individual may have more rights and privileges; but to maintain those privileges, he must accept greater responsibilities and obligations. The democratic process calls for active participation by the individual.

Many organizations list among their objectives citizenship training. The "Ten 4-H Guideposts"[1] include sharing responsibilities for community improvement and serving as citizens in maintaining world peace. The eighth purpose of the FFA is "to develop character, train for useful citizenship and foster patriotism."[2] The National Education Association included good citizenship as one of the seven cardinal principles of secondary education.[3]

Each individual when seeking citizenship in any community must offer service to the community and strive to make it a better and safer place to live.

NATIONAL CITIZENSHIP

The objective of our citizenship training program is ultimately Americanism. The principle, that the interests of all people are above those of any special interest or any class or section of the population, should be maintained. To accomplish this, the individual must understand the principles of American government. Organizations should promote an understanding of the democratic process and bring more individuals into a participating role. The democratic process is participation. Citizenship as an American gives the individual certain inalienable rights, such as: Freedom of worship; freedom of speech and press; freedom of assemblage; freedom to work in such occupation as the experience and qualifications enable him to secure and hold; freedom to enjoy the fruits of his work; and the right to pursue happiness as long as it does not harm others. These rights carry great responsibilities. The individual as a citizen is charged to that end, that all individuals have these rights.

---

[1] ABA Bulletin, 7, "Building for the Future with Farm Youth."

[2] Ibid.

[3] U.S. Office of Education, Bulletin 35, "Cardinal Principles of Secondary Education."

A citizen, as opposed to a subject, implies allegiance to a state in which the power of government is retained by the people.

TRAINING FOR CITIZENSHIP

It is important to develop loyalty to family, friends, school, organizations, community, and country. Loyalty is developed by being made to feel a part of the group. Individuals also need to be reminded of the part they play in the government. Pride, in whatever part the individual might have in any activity, tends to make that individual proud of this association. Repsect for and support of the laws and those persons in authority is developed within the individual in direct proportion to the individual's feeling or participation. This respect may be developed in an athletic contest or in a student council meeting. Individual allegiance to the Flag is a must when that individual may be called on to defend it against an enemy. Allegiance to the Flag may be a mental attitude and can be developed in the individual that understands and believes in the democratic process and the American way of life. Allegiance to the Flag should be practiced and developed by not only potential leaders but every individual.

SUMMARY

Responsibilities of citizenship should not be confused with blind obedience. The citizen has the responsibility not to castigate but to evaluate and serve in whatever capacity is most beneficial to the greatest number - not to decry but to have faith in the destiny of the United States of America. John F. Kennedy emphasized this responsibility by saying, "Every citizen holds office."[4]

STUDY QUESTIONS

1. What is the goal of leadership education?
2. What might be said to contribute most to citizenship?

---

[1] Kennedy, John F., "Every Citizen Holds Office," Minnesota Journal of Education, 45:20 (Dec., 1963).

3. How does membership in a group effect one's status as a citizen?

4. In what way do responsibilities increase as size of the group increases?

5. How is citizenship fused with education?

6. How can Americanism be achieved?

7. How can every citizen be considered an office holder?

8. What is the difference between a citizen of a country and a subject?

16 RESOURCE MATERIALS AND THEIR USE

A vital part of leadership is knowing how to locate, select and use resource materials. People represent a rich source of program resources. Resource materials are becoming increasingly popular in the educational field as well as in carrying-out group studies and surveys. Resource materials are interest builders, provide clarification, aid problem solving and authoritative information in a specific area. A resource is valued because it is useful in achieving objectives. It is a means to an end, although many times it is considered an end in itself. It is not self-sufficient. It should be thought of as a means of "enriching a program or meeting" rather than taking the place of it. A speaker is an example of a resource person.

KINDS OF RESOURCES

Resource materials can generally be classified two different ways. They may be placed in two major categories or four smaller classifications. The two major categories are concerned with experiences received from them. Direct experience involves the group members taking part in mechanical operations, drawing plans or traveling. The second-hand experience refers to a speaker, book or film which stirs the imagination of the members and enlarges their understanding of the subject matter.

The four smaller classifications are based on the type of resource. Examples of these are as follows:

Human resources are guest speakers, debates, symposiums, panels, group interviews, chalk talks, dramatics, consultants, specialists and demonstrations.

Printed material is composed of books, pamphlets, study guides, discussion guides, manuals, newspapers, magazines, periodicals, catalogs and reading lists.

Audio-visual aids include the blackboard, motion pictures, slides, filmstrips, charts, graphs, maps, globes, photographs, exhibits, bulletin boards, puppets, radio, television, phonograph records and tape recordings.

Group activities refer to field trips, pageants, role playing, discussion, arts and crafts activities, and skits.

SELECTION AND USE OF RESOURCE MATERIALS

The selection and use of resource people and materials is of great importance. Because the selection and use cannot be easily separated, we will discuss them together.

Before selecting any resource, the goal or objective should be clearly in mind. Ask this question: Just what am I trying to accomplish? The use of irrevelent material has often retarded or completely destroyed any learning or accomplishments up to the time of its use.

It is well to remember several steps to follow when using resource material or people. Such as:

1. Put the group or audience in the proper frame of mind so they will be receptive and able to understand the presented material.
2. Give them a brief preview of what is to be accomplished and urge them to write down or ask any questions which may come-up during the presentation or activity.
3. After the material or activity has been used, an evaluation must be conducted to determine if the desired objectives have been reached.

If a guest speaker is to be used, keep in mind that he must know what is expected of him, and he must know the type of group he will be facing. The speaker should be extended all the courtesy possible and be properly thanked for sharing of his time and experiences. Although the guest speaker furnishes the material for the program, the group leader is still in charge of the meeting. It is his responsibility to see that the necessary equipment is present, that discipline is maintained and that proper courtesy is given to the speaker. It should be quite clear that the use of

resource materials is not a substitute for the leader, but a supplement. The proper use of resource materials may require more time and effort on the part of the leader than it would have if he had presented it himself.

LOCATING RESOURCE MATERIALS

There is an abundance of resource people and materials if you know where to look. Often these materials are so near that they are overlooked. Most communities have an abundance of resources from which to make a selection. Just as there are resources in any community, there are also resources in any group. Individual members have different kinds of knowledge, skills, abilities and experiences. The problem lies in locating these skills. If the group is to function for a long period of time it would be wise to learn the special skills and abilities of the individual members. This can be done by having them fill-out questionnaire cards or by verbal means. Excellent resource people and materials can be located in community enterprises, institutions and agencies, many of which are not directly associated with education. Other sources are National Organizations, local Branches of Federal Agencies and local organizations.

National Organizations include city, county and state boards, bureaus and departments; health, welfare and civil services; budget and finance; elected officials; and police. Also, there are judicial administrations; highways; sanitation; recreation; building and zoning; education; commerce; labor; agriculture and legislature.

Local Branches of Federal Agencies can be found by referring to the phone book. Some of these are the Agricultural Extension Service, Soil Conservation Service, Economic Research, Farmer's Home Administration and the Forestry Service.

Local Organizations will vary depending on the size of the community and the area it serves. In the community, it is often possible to find universities and colleges, public and private schools, settlement houses and group work organizations, welfare and charitable organizations, community and adult education councils. In addition, you may find commercial and industrial concerns, professional societies, business

associations, libraries, museums, churches and labor unions willing to lend assistance.

It must be remembered that educational resources for use in classes and other groups covers much more than resource speakers; and to be effective, proper steps must be taken in preparation and follow-up. It cannot be over-emphasized that the use of these resources should not be abused; they are meant to assist rather than replace the group leader.

STUDY QUESTIONS

1. How are resource materials used?
2. What are the four main types of resource materials?
3. What kind of preparation and follow-up is recommended when using resource materials?
4. What kind of preparation and follow-up is recommended when using resource people?
5. What are some sources of resource people and materials?

17 SOCIAL ACTIVITIES

Social activities or entertainment lend an air of relaxation to a usually tense meeting or gathering. Social activities do not always mean stiff formal affairs, but can be used advantageously at meetings as an "ice breaker" at the beginning; or they may be used to end a meeting on a note of gaiety or good will. Therefore, it is necessary that we lend some time to the role that socializing and entertainment play in the overall individual and group leadership plan.

NEED FOR SOCIAL ACTIVITIES

Very few people can live the life of a hermit and withdraw from society. Because people are gregarious, it will be necessary for them to learn how to enjoy their relationships with others as well as carrying on sober business dealings. Most group meetings incorporate some type of entertainment in their programs. In the case of youth groups and some adult groups, there is a need for training in the art of friendly conversation and being able to relax with other people. Group entertainment such as group singing often encourages many people to participate in the activity and usually "breaks the ice" for the discussion period to follow. Many meetings open with group singing. Entertainment or light lunches and refreshments at the end of the meeting gives the group a "change of pace" from the business session. Lunch or entertainment often encourages members to attend. Often individuals will attend a meeting for the lunch, party or refreshments. In so doing, they become exposed to the business meeting. There are probably many individuals who have become interested in the objectives of the organization because they were lured to it by lunch and social affairs.

KINDS OF ENTERTAINMENT OR SOCIAL ACTIVITIES

Entertainment or social activities may be utilized by groups in two ways: They may be the main purpose for the gathering, or they may be a part of the meeting. Entertainment meetings may take the form of banquets, picnics, or pot-luck dinners. They may promote fellowship among the members or often they can be used effectively to recruit new members. New individuals introduced to an organization in this manner may develop a bond of friendship with the members in this informal atmosphere. Banquets are often used by organizations to give recognition to its outstanding members or to helpful people in the community. This close community association may bring the organization favorable publicity.

Entertainment or refreshments for some individuals are the highlights of any meeting. As was mentioned previously, many individuals will attend meetings only if entertainment is provided or refreshments are served. Lunch and refreshments usually are served at the end of the meeting. This tends to hold members after the business is transacted and possibly the best and most fruitful discussions of business occur at this time. Group singing helps get many members in high spirits and opens the door for free discussion later on. It is advisable to have a piano or other instrumental accompaniment whenever possible. Always furnish the group with song books or song sheets. Many meetings open and close with group singing. Speakers and movies are effective interest-builders. They are usually used as entertainment or relaxation and this is what the audience will expect. It will be necessary to obtain the services of some speaker whose experiences or informational material is of great interest to everyone. The same is true of motion pictures. Movies should be carefully selected when used as entertainment. Games and dancing are enjoyable to certain groups, expecially youth or family groups. Recreational games of the

indoor or outdoor variety are recommended where friendly competition among the group can be established. Square dancing or folk dancing are usually popular forms of recreation. This recreation takes place after all business has been completed.

PLANNING AND CARRYING-OUT ENTERTAINMENT AND SOICAL ACTIVITIES

To be effective, entertainment must be carefully planned and carried-out. This insures maximum participation and enjoyment by everyone and will reduce confusion and disorder during the activity. It is not necessary to provide a large amount of entertainment; if it is emphasized too much, the attention of the organization may revert from the business to entertainment as being the major objective. The place on the program must be carefully selected so that the maximum benefit may be received. Group singing may be most effective at the beginning; whereas, refreshments should be served afterwards to eliminate competition with and distraction from the business items. A committee or some responsible individual should always be in charge of making arrangements, serving and cleaning-up. In the case of banquets and picnics, it may be necessary to appoint special committees to be in charge of such items as food, program, arranging for suitable facilities and clean-up. Many of the activities will require financing to varying degrees. Some organizations budget for entertainment and social functions, while others operate on a donation basis. When sending out meeting notices, it is always a good idea to include the entertainment on the billing. When organizing meetings, don't overlook the importance of entertainment. It behooves the group leader to make ample plans for this portion of the program. By doing so, he will usually have a happier and more cooperative organization.

STUDY QUESTIONS

1. Why are social activities and entertainment desirable parts of leadership?
2. What purposes do entertainment meetings serve?
3. What kinds of entertainment can be organized?
4. Why should extreme care be exercised in selecting the place on the program for entertainment.

18 ADVISORY DUTIES

The advisor's function to an organization is to help the organization help itself. The advisor should guide, encourage and assist members of an organization. Advisors have specific functions such as helping members learn their responsibilities. Programs can profit from advisory functions as well as organizations. Many organizations have advisory councils or a board of directors while other organizations have advisors, such as the Boyscouts, F.F.A. and Campfire Girls.

TRAITS OF A GOOD ADVISOR

The person taking over as an advisor of a club, organization or as one of the directors should have the following traits: Be a respected member of the community; have an interest in people, the community and the organization; and have available time that he can spend on the job. The advisor should also have a knowledge of the goals of the organization, be a mature individual, have a working knowledge of parliamentary procedure and be a student of group dynamics.

ROLE OF THE ADVISOR

In every organization the advisor has specific responsibilities that he must carry-out and see that they are accomplished. Some of these functions are: Coordinate the policies of the organization; offer guidance to the individuals and group; provide material for the group that will be needed in carrying-out projects; train leaders through group dynamics; help develop a code of ethics and policies for the organization, and help evaluate the program.

EVALUATION OF THE PROGRAM

Every advisor, director or member must be able to evaluate the program of the organization to determine if the goals and objectives that are outlined in the program are being accomplished. A good evaluation may come from the state officials or other outside people. Some points to consider in evaluating the program are: Does it include every member? Does it meet the objectives of the organization? What are the accomplishments? This can be done with the help of the state officials, advisory committees, resource people, and the organization itself.

GROUP RESPONSIBILITIES TO THE ADVISOR

Officers and members need to realize that the advisor is there to help them if the need should arise. Each member should have a familiarity with the organization and what it is designed to do.

Officer meetings: The executive committee represents the steering and planning committee. It includes officers and the major committee chairmen. It is the duty of the executive committee to indicate to the other committees the aims, purposes and goals of the organization. Remember, the advisor should offer guidance in helping the group make decisions.

Decision making: Too often the advisor or directors make some of the major decisions without first consulting the group. All persons in an advisory capacity should refrain from doing this as much as possible. Similarly, it would be wrong for individuals or the group as a whole to make decisions effecting the organization's welfare without consulting their advisor.

ADVISOR'S DUTY AT MEETINGS

Committee meetings: He must have clearly in mind the problems to be discussed. He should have an idea of the decision that should be made (one that is of benefit to the organization and not just to a few). Development of good leadership traits will

take place if the correct procedure is used. The advisor should see that every member of the committee takes part, that a report is written and that satisfactory parliamentary procedure is used.

Group meetings: Offer advice only when the need arises; he should not try to dictate to the organization. Be ready to offer suggestions for the correct procedure. Give direction to the program and not lose sight of the educational values. He should never abdicate his office or role.

Program planning: He should provide reference material to aid in program planning. Analize needs and stimulate members to assume goals as well. Program planning is a continuous thing, but it must be evaluated periodically.

Special functions (trips, exhibits, banquets, etc.): Guidelines for special functions should be set-up by the group and the advisor should see that these are carried-out. At many organization functions, the advisor or leader sets-up all the rules for trips, awards and banquets, causing the members to become disinterested.

Group participation: The advisor should make available opportunities and information of events to the group. He should encourage member-participation from the standpoint of leadership training available to the individuals and group.

PARENTS' ROLE IN LEADERSHIP TRAINING

It should be stressed that parents have an important part in training leaders in the home through guidance, correct discipline and encouragement. There is a high correlation between successful leaders and interested parents. It would be suggested that these interested parents in a leadership school be oriented on leadership.

LAY ADVISORS

Lay advisors include such people as local leaders of the 4-H, Boyscouts and Campfire Girls. They should become familiar with the duties and responsibilities of an advisor. In many cases the professional advisor is the public relations or executive secretary of the organization. Other professional advisors are teachers that have organization incorporated into the school curriculum. A board of directors or an executive committee can function as advisors.

STUDY QUESTIONS

1. Give the traits an advisor should possess.
2. Who should be an advisor?
3. How would the advisor go about evaluating his program?
4. How much time should be set aside by the advisor?
5. Who can help the advisor with the evaluation program?

19 FINANCING ACTIVITIES

Adequate financing is essential to the accomplishment of worthwhile purposes for any organization. While money may not automatically cause an organization to be a fire-ball of activity, it may help remove the barriers that otherwise stand in the way of success. The needs of the organization should be the determining factor in deciding what the financial needs are. Money should serve as a means to an end but should never be allowed to become an end in itself. An active organization engaged in many worthwhile activities will need more money to carry-out its program than the do-nothing organization. Activities such as club tours, trips, dinners, paraphernalia, donations to charity, publicity programs, awards and scholarships cost money; but these activities add much to the worth of any organization. Money to finance the activities should be the goal of any organization.

METHOD OF FINANCING

The methods of financing used by most organizations can be described under two broad categories as dues and activities. Dues may be a satisfactory method of financing the organization that needs little money to carry-out its program of activities. Dues should be kept to a minimum and should serve as a ticket to membership rather than a method of financing. Dues serve a purpose if they give the member a sense of belonging. A form of dues sometimes used is a member assessment to finance a single activity. Dues in itself do little to encourage member participation. Activities conducted to raise funds are of value in many ways. The activity may contribute to the organization's leadership and educational objectives by furnishing worthwhile activities that offer opportunities for participation by many members. Fund-raising activities often will raise large sums of money in a short time to finance ambitious programs that would be difficult to finance in other ways.

SELECTING ACTIVITIES

Activities should be selected on the basis of their contributions to the objectives of the organization. These activities can be evaluated according to the following criteria: Does the activity conform to the nature and purpose of the organization? Does it compete with activities of other worthwhile organizations or local businesses? Does the activity offer a fair return in terms of service tothe community or to the people who are asked to support the activity? Does the activity serve a need or render a service to the school or the community? Does the activity furnish opportunity for member participation? Is the activity morally acceptable to all members? Avoid activities that fail to raise money commensurate with the time and effort expended; that have been overworked in the community; that may be legally questionable; and which may cause adverse publicity.

SUGGESTED ACTIVITIES

Any list of activities will necessarily be inadequate and can only serve as examples. Some that may be acceptable for some organizations are completely foreign to the nature and purposes of others. The following list is no exception.

Organization Calendars
Slave auctions
Christmas card sales
Livestock & crops production
Raffles
Athletic contests
Fair exhibits
Install seat belts
Barbeques
Bazaars
Stunt night
Bingo
Baby chicks
Rummage sale

Birthday calendars
Building equipment
Contests
Box socials
Breakfasts
Talent shows
Hootenanny
Turkey shoots
Barn dances
Pot-luck dinners
Banquets
Agricultural signs
Transplants

Concession stands
Magazine sales
Cooperative buying & selling
Dances
Pancake suppers
Record hops
Mutural insurance
Rodeos
Square dances
Carnivals
Community auctions
Machinery hire
Rodent control

BUDGET

The first step and perhaps the most important step in financing is preparing the budget. The budget should be prepared to serve needs of the organization in carrying-out its program of activities for the year. When the financial needs have been

determined, select activities that best meet the needs of the organization.

AUDITING

Whenever financing is necessary, an audit is also necessary. Each organization should keep a record of all finances and be able to account for all moneys expended during the year. If no tax moneys are involved this audit can be done by a committee appointed by the president of the organization.

STUDY QUESTIONS

1. How can money help spell success for an organization?
2. Why do some of the most active organizations require the most money?
3. Name some activities that require money.
4. Name some activities that add worth to an organization.
5. What are two general methods of financing the activities of the organization?
6. What value to the organization may be served by dues?
7. In what way does the money-raising activity serve the organization?
8. List 30 ways of raising money for organizations.

20 NEWS MEDIA

Every organization, at least almost every, should publish a periodic news report to its membership and affiliated group. This media may be a magazine, a bulletin, or a news letter. This is generally a monthly publication or may be weekly, bi-weekly, quarterly or annually.

The purpose of a news media is to stimulate interest in the organization among its membership and to highlight important activities in its program of work. A good club news publication serves a purpose similar to that of the local newspaper. Its publication serves as an historic record of club activities and as a basis for evaluating the club's program. A good news publication will serve its greatest purpose in stimulating active membership and encouraging the work of individuals and groups.

FORMAT

Bulletins or newsletters are either duplicated or printed. Some groups may print their masthead and duplicate the body of their newsletter or bulletin. An 8½" x 11" sheet is the most common size for duplicated bulletins. Heavy paper stock permits utilization of both sides.

There are two printing processes - letter press and offset. Letter press is printing on paper direct from type or engraving. Offset is a photographic process in which the matter on the printing plate is first printed on a rubber-covered cylinder which then transfers it to the paper.

FINANCING

A one- or two-page duplicated news media need not be an expensive item. A major cost may be postage. If a large number of copies are produced, printing may be

most favorable and is versatile for using photos. Available finances will provide a quick decision on the type of bulletin or magazine which can be produced. Financing may come from (1) club funds, (2) dues, (3) subscriptions, and (4) advertising. Most organizations use little or no advertising.

CONTENT

A favored item for news media is that of coming events - listing dates, speakers, and programs. Reports on work of committees and affiliated groups is a major item. Pictures are always welcome and well received. Biographic sketches of new and old members serve an historic purpose and stimulate fellowship. Attendance is a major item to stress in all news media. This may be attendance at meetings, conferences, and on special occasions. Club information is a major item for club membership. This may relate to objectives, activities, history, items to buy, scholarship programs and educational materials.

EDITOR

Each news publication is dependent for its continuous life and content on its editor and his staff. These people usually get paid wholly as a contribution of service. In larger organizations they are paid for their services, often a nominal fee.

STUDY QUESTIONS

1. Why have a club bulletin?
2. How can club news media be duplicated or printed?
3. What items should be included in organization magazines or bulletins or newsletters?

21 INDIVIDUAL LEADERSHIP OBJECTIVES

The overall objective of individual leadership is to cultivate those desirable personal traits and abilities which will best fit the individual to grow in knowledge and understanding to meet life's situations in our democratic society.

Specific Individual Leadership Objectives Are to:

1. Practice and develop personal traits and attitudes - such as friendliness, appearance, sincerity, humility and depend-abiltiy - which are all admired by co-workers.
2. Develop the arts of speaking, writing and listening.
3. Develop a working knowledge of group processes and the role of the individual in group programs and efforts.
4. Recognize the need for hard work, experience and continuous learning.
5. Develop more fully those individual qualities of citizenship which are achieved by leadership training and practice.

22 TEAMWORK

Almost everyone appreciates the efforts of a winning team on the playing field. It is almost sheer beauty to observe the individuals, captains, and coaches functioning as a closely-knit unit. Likewise, it is a thing of beauty watching the lift-off of a space craft as it prepares to go into orbit. We all know this would not be possible without teamwork between the workers, the technicians, and the scientists. Coordination is the key in leadership through teamwork.

TYPES OF TEAMWORK

Already the athletic form of teamwork has been mentioned and also the scientific type of teamwork. In other areas the team might consist of members, officers, and advisors of an organization; or teachers, administrators, and a school board; or possibly salesmen, supervisors, and a board of directors. Whatever the case, it is becoming more and more important to give each part of the team equal rating in over-all importance.

COORDINATION

It is all too easy to separate the parts of the team into their own little groups and then argue over who is going to do what. Too many groups operate under the authoritarian procedure of pointing the finger and saying, "You do this or you do that."

Coordination between the three major components of a team will not only mean more effective leadership but also that more will be accomplished. Coordination among community groups, organizations, or agencies produces a sense of togetherness and harmony. In some instances there is evidence that several groups are trying to achieve the same goal but are all pulling on a different rope. They need coordination in order to tug together. Coordination tends to raise the whole level of leadership to a higher plane.

SUMMARY

Almost without exception, in our rapidly changing world, the cry for leadership is becoming louder and louder in all groups and organizations. More needs to be done and in less time than seems possible to accomplish the task. If the challenge is to be met, it must be done through teamwork.

Teamwork needs to be practiced, not preached.

STUDY QUESTIONS

1. What are some values of teamwork?
2. What types of teamwork may be found?
3. Explain how coordination is an important factor in teamwork.

23 DECISION MAKING

If each individual's destiny were predetermined, his need to make decisions would be nonsense. However, as we all well know, it is not. Therefore, it becomes necessary for one to make decisions in order that he may establish steps in determining his own destiny. Decision-making is the settling of a matter to satisfy the needs of an individual or of a group. More accurately, it should be defined as the settling of a matter to satisfy the needs of an individual; because it more often than not does just that.

FACTORS WHICH AFFECT DECISION-MAKING

The human being possesses great abilities to determine his own destiny. However, the following factors limit this ability:

Man is limited to making decisions by his own heredity and environmental exposures. If he has neither the intelligence nor had the environment necessary to make positive decisions; this becomes a handicap.

Moral choice limits man to opinions or free choice. He is granted freedom to choose only in order that he may reveal his religious and ethical qualities and demonstrate his moral stamina.

Some people are puppets, which limits their decisions to the options of others because of the invisible strings attached. Yet, they take the responsibility for their decisions.

Cultural influences effect the freedom of choice. Social codes and social pressures would fall under this. This type of person, or group, would make decisions concerning themselves as well as the social effect it would have because they are part of a group.

Psychological status of an individual has an effect on an individual's interaction to decision-making. This involves a feeling of insecurity because of psychological difficulty. There is a feeling of guilt over treatment of others and an interaction in jurisdiction over these feelings results.

DEVELOPING THE ABILITY TO MAKE DECISIONS

Have determination. The more determined one conceives his choices to be, the more sure he will be of his decisions. Don't question your own integrity but become increasingly aware of your unacknowledged and acknowledged personal interests. Have motivation. Decisions are related to motives and when you can evaluate these, you have good motives. Examine thoroughly all possibilities of a problem. Listen carefully and consult often. Explore where feasible and experiment boldly. Don't pussyfoot, sidestep, straddle or walk the fence. Take sides and always know where you stand. Feelings are related to decision-making. If you can understand your own feelings you will be better able to make a free decision and a more accurate one.

DECISION-MAKING AS A GROUP

Decision-making as a group is based on the ability of each individual in that group to make decisions. In general, there is a minority that expresses the decision but each individual has an influence on it. If a group is dominated by fatalistic-type people, people who make decisions through influence from other people, it will be a group that has small actual authority of its own. If a group is dominated by free-will type people, its authority in decision-making will be more than empty gestures in behalf of the group.

24 DEMOCRATIC PRINCIPLES

Democracy means a way of living, an effort to run society by its members deciding what should be done.

A democratic group is one in which the control of the group resides in the members. It is a government of the members, by the members, and for the members. The nature of our society is such that democratic leadership is a sound choice. It develops people, it is consistent with our way of life, and it works. Our society is one in which the concept of individual opportunity and individual worth is recognized. Efforts are continually made to maintain that freedom for the individual.

BASIC CONCEPTS OF DEMOCRACY FOR ORGANIZATIONS AND SOCIETY

This we believe, that:

1. The individual person is of infinite worth.
2. Each person has capabilities and talents that can make worthwhile contributions to his group.
3. Society should make adequate use of all the many talents of its members.
4. Each person should have a high sense of moral obligations to strive for the common good.

Principle of Habit - We tend to be comfortable in repeating the way things are done. We may follow a group used to a dictator-leader or use the laissez-faire approach.

Principles of Group Consensus - Group process can be like a chain reaction - one idea can stimulate many new ideas. Leadership is essential to effective group effort. Someone must lead in order for a group to function as a group. Within this group leadership may be either democratic or autocratic leaders. In a democratic group, the group decides what action it is to take and how the action is to be carried-out. In the autocratic group, the members have little choice on how the actions are to be carried-out. Autocratic leaders do not derive their power from the will of the group. The autocratic form of leadership cannot compete with the democratically led people in all-round productivity. The democratic process favors group leadership as well as individual leadership. Within the democratic groups we find more friendliness, less discomfort and more interest in the problems of the fellowman and more group consensus. The democratic leader does not attempt to influence the people, but to aid the people in solution to the problem at hand.

THE IDEAL OF DEMOCRATIC LEADERSHIP

The opportunity for everyone to participate in the deliberations and actions of the group is the most important ideal. Our American tradition emphasizes equality for all group leadership situations. Many leaders lose sight of this in an effort to gain favor. The strength of democratic participation lies in the fact that different individuals have equality in all situations. The respect of one for the others, even though there is a difference of opinion, is basic to the ideals of democracy. Without this, we could not live in a democratic society. This ideal must develop a give-and-take attitude in arriving at decisions. In a democratic society the group is the authority, while the leader serves the group. We will not survive as a democratic group or nation unless this authority is carried-out. The process of group dynamics exemplifies the basic concepts of democratic principles.

5. The individual should be a self-directed and a self-responsible person.
6. Each person should have a fair and equal chance to live fully and have the opportunity to develop his capabilities to their utmost.
7. The group has both the right and capacity to choose its own leaders and to determine their function.
8. The group has both the right and the capacity to make its own decisions.
9. Decisions reached by an informed group are usually more sound, better understood, and more likely to be carried-out.
10. Democracy involves control of both individual and group conduct for the common good. That control is vested in the individuals constituting the group and comes from a sense of moral obligation.
11. Arbitrary control by an individual over the lives and fortunes of others is morally wrong.

BASIC CONCEPTS STATED AS DEMOCRATIC PRINCIPLES

Principle of Challenge - It is through challenge that individual group members and leaders themselves move to the forefront of knowledge and obtain creative ideas. Challenge develops enthusiasm and leads to exchange of ideas.

Principle of Participation - Principle of participation is built on the concept of individual faith in oneself. Even the simple tool of voting on minor issues gives one the feeling of satisfaction.

Principle of Sharing - A leader who is willing to share the responsibilities of leadership is one who will find that hard work of getting results can just as readily be shared with those with whom he works.

Principle of Knowledge - In addition to knowledge of subject, the democratic leader must have knowledge of the individuals with whom he works.

25 MORAL LEADERSHIP

One of the objectives of leadership education has been listed as one's own self-improvement. This includes moral leadership or character development. People as well as groups need to practice and develop moral habits.

HABITS AND THE MORAL LAW

A habit is said to be a condition of the mind or body which results from a frequent performance of an action. Animals learn to walk, swim, and fly by instinct. Man acquires the arts of walking, swimming, and talking by practice. Habits are said to be good or bad as they are the results of actions that are right or wrong.[1] A person of good habits is said to be a person of good morals. Bad habits are the results of wrong actions and are violations of good morals. If our conscience tells us that any habit is wrong, it is our duty to change it. This is not always easy. Avoiding temptation, keeping busy, and being honest with yourself are steps to take in breaking bad habits.

Knowing right from wrong is usually found within one's own conscience, which in turn comes to us from the Moral Law. This law may be defined as a rule of action prescribed by God to mankind concerning their duties to Him and to each other.[2] Of course this is referring to the Ten Commandments which remain unchallenged in our society as the absolute as far as moral principles are concerned. All great leaders

---

1 Gow, Alex M., "Good Morals and Gentle Manners for School and Families," Amer. Book Co.

2 Ibid.

and groups have shown a high degree of conformity to the Moral Law. Reverence, manners and actions are fundamentals in our way of life and need to be practiced at all times.

CHARACTER BUILDING

There are four cardinal virtues related to character building which should be kept in mind not only by potential leaders but by everyone. They are as follows:

1. Prudence - being able to conduct and discipline oneself by reason.
2. Fortitude - refers to having courage, backbone, and firmness of convictions.
3. Temperance - would be to practice moderation not only in appetite but in other passions as well.
4. Justice - is to practice integrity and to be just when dealing with others.

PERSONAL CHARACTER TRAITS

Self-Control: This is an important character trait which needs considerable practice. Controlling one's temper, keeping a cool head, and avoiding rash decisions are abilities very much desired in leaders.

Patience: Is a quality of self-control which is of the utmost importance and requires almost continuous practice. Many have failed to reach the top as a leader because they had little patience or self-control.

Honor: Honor has an important place in the Moral Laws. One who seeks to live by an honor code will command a high degree of respect from others. Lack of veracity has been the downfall of many potential leaders. Failure to practice honesty leads to many of the so-called vices of life. Dishonesty, intemperance, jealousy, suspicion, wastefulness, vulgarity, bragging, drinking, irreverence, selfishness, laziness are but a few of the vices due to lack of one's honesty.

Manners: Good manners assist not only potential leaders but also leaders in reaching their goals more easily. People are quick to respond to a person who shows

politeness and good breeding. These are two important character traits which usually require practice and further development. Civility, consideration, and politeness give a person a great advantage when dealing with people; therefore, they should be practiced and studied conscientiously.

CODE OF ETHICS

Many groups, organizations, and even individuals develop a code of ethics or set of rules to live and work by.

Benjamin Franklin, as a young man, developed a plan to prevent himself from committing faults. He merely set down some character traits in a little book which he always carried with him. Franklin developed the habit of checking-off those virtues he was able to accomplish, adding new ones and then trying to master them. He developed his own personal code of ethics.

An example of items to include in a code of ethics for an individual or for a group would be as follows:

1. Being honest and not taking unfair advantage of others.
2. Be active in religious, community, and civic affairs.
3. Strive for self-improvement.
4. Be polite and courteous at all times.
5. Honor thy father and mother (The Ten Commandments).
6. Attend meetings promptly and participate in the meeting.
7. Dress neatly and appropriately for all occasions.
8. Take pride in your organization, your community and your country.

STUDY QUESTIONS

1. How are habits formed?
2. Name the four cardinal virtues of character building.
3. What is the Moral Law?
4. Explain how self-control, honor, and manners enter into leadership.
5. What is a code of ethics?

26 ATTITUDES

Attitude is defined as a manner of acting, feeling or thinking that shows one's disposition or opinion. Attitude has been said to be the key to success or the ball and chain of failure. There are many attitudes which are desirable in leaders. Some of these are dependability, courteousness, promptness, industriousness, cheerfulness and competency. Because leadership begins within oneself, it is up to the individual to be aware of and develop those attitudes which are most beneficial. Many employers consider attitude as important as a job skill in their employees. Good attitude makes for more harmonious working conditions.,

DEVELOPING ATTITUDES

A good attitude will attract and interest people while a poor attitude will repel them. The difference between a good and a poor attitude is not always readily apparent. Sometimes a rather critical evaluation is required to find what is missing in a leader's attitude. There are many attitudes which are important factors in good leadership. Leaders as well as the group should develop a positive attitude toward the job at hand. It has been said that no one ever sold a product with an apology.

Altruism: Leaders and the group should have an altruistic attitude toward each other. Everyone should have an opportunity to state his interests and opinions if he desires. This cannot happen if certain individuals have no regard for the rest of the group.

Friendliness: A friendly attitude is a valuable asset when managing people. Being friendly invites people to be friendly in return. "People are like mirrors: Smile and the world smiles back, scowl and the whole world scowls." (Donald A. Laird, The Technique of Handling People)

Directness: When talking to people, do not talk to the ceiling or out the window. Look them in the eye periodically and talk directly to them. This will establish a personal contact between the speaker and listener or listeners. Everyone likes to be looked at when being spoken to. However, do not try to stare them down. This may cause an uncomfortable feeling.

Sincerity: A leader should be very sincere about his job. An earnest and sincere attitude will tend to draw interest and enthusiasm for the task ahead. If a leader is not sincerely interested, the job or project is likely to be passed off as unimportant.

Knowledge: To do a good job of leading, a thorough knowledge of the job at hand is required. Also, a knowledge of the individuals' interests and capabilities. This will enable the leader to control and guide the group toward the desired goals.

STUDY QUESTIONS

1. Why is it difficult for an individual to evaluate his personal attitudes?
2. What are some of the attitudes which are desirable in leaders?
3. What is altruism?
4. Why does sincerity on the part of a leader draw enthusiasm from the group?

27 COMMUNICATION

Communication includes all methods of conveying any kind of thought or feeling to other people, or of receiving expressions of thought or feeling from others. In order to communicate effectively and efficiently, a leader must understand the basic communication process. Communicating is a daily problem in our ordinary living. How are we to be understood by our fellowmen without clear communication? In communicating effectively, we achieve personal success and satisfaction as well as improving the society in which we live.

BASIC FACTORS IN COMMUNICATION

Thinking: Thinking is a fundamental factor in communication. Thinking is not easy. Many times people do not think before saying something. Usually it is a case of blurting out the first thing that comes to mind. Ideas are a result of thinking and the quality of the idea is dependent upon the amount of careful thinking used.

Ideas: To convey an idea or thought is the whole purpose of communication. Everyone has many ideas, whether constructive or destructive. When conveying ideas they should be designed to accomplish one's purpose. Careful thinking before stating an idea is necessary for it to convey the desired meaning.

Emotions: Emotions can influence the kind of thinking as well as the ideas expressed. Therefore, the individual must try to be rational with emotions and not let them influence clear thinking and good ideas.

A FORMULA FOR COMMUNICATION

A formula is thought of as something which works every time it is used; but, remember that the right items must be used in a formula in order for it to work. This is especially true in communicating ideas. Determine what the answer or end-

product of the communication formula is to be, then put the right ingredients into the formula through careful thinking and the answer will come out correctly.

FORMS OF COMMUNICATION

Most people are past the state of communicating basic wants by a long howl such as a six-month-old baby might use. This is the first means of communication in life.

Writing: Writing is an expression of a thought or an idea on paper in readable form. Here again we encounter the basic fundamental factor in communicating, that of thinking. Time spent thinking while writing an article is the hard part. Once you have an idea or ideas firmly in mind, putting them on paper is easy. Thinking about what you want to write pays dividends two ways.

> "You know what you want to say, and the expressions come more easily and rapidly when you do not have to plan as you write. Moreover, the planning will be reflected in the quality of your expression, both because your mind will be free to concentrate on the details of expression and because your ideas will be clearer."[2]

Paragraphing: Paragraphs divide a paper into its various units of thought. A unit of thought should be clearly stated in the first sentence and then further developed in the remainder of the paragraph. An article should be made-up of paragraphs which tie all the thoughts together. This can be done with transitional words, such as - therefore, consequently, etc.

Sentencing: Sentences make-up the content of a paragraph and must contain information, be clear, and have a logical order. Sentences can be of varied length and structure in order to obtain desired effects. A short sentence is desirable to a longer one as long as the idea is conveyed to the reader. Wordiness should be avoided in sentence structure. This can be done by removing unnecessary words or by combining sentences which convey the same meaning.

---

1 Laird, Donald, The Technique of Handling People, Whittlessey House.

Editing: Proper editing in writing an article is the most important step to success. Good ideas and thoughts can be present, but if they are not in good sentence and paragraph form, they often go unnoticed. To successfully edit an article it is necessary to concentrate on one thing at a time. Too much interest should not be placed on the subject matter or the grammer, but carefully analyze the two together. Following are some basic steps to editing after an article has been written:

Proof-reading by the writer - It is best to go through the article paragraph by paragraph to check for content and method of expression. Then check the article sentence by sentence for style and content. Finally, check for grammar, punctuation, and spelling.

Re-write the article in corrected form after it has been re-read.

Have the article corrected by someone else, using the same steps as described above.

Re-write the article as agreed upon by the author and the proof-reader.

Speaking: Speaking is the process of expressing an idea or ideas orally. In speaking, just as much care must be exercised in selecting content as in writing. Remember, more time is spent speaking than any other form of communication. Important but often overlooked methods of communication are gesturing and facial expressions. Often a gesture or expression can take the place of many words, but careful thought should be given before using a gesture or expression.

READING AND LISTENING

Reading and listening are forms of communicating, but instead of giving forth information, it is received. Being a good listener or reader is just as important as being a good speaker or writer. When reading or listening, the individual should formulate his own thoughts and ideas on the presented material. If we expect to be listened to, we should be able to listen.

COMMUNICATION AND GROUP DYNAMICS

Communication is a vital part of group dynamics. There are three parts to communication in group action. They are (1) the sender, (2) the message, and (3) the receiver. Those three parts are necessary so that facts or knowledge can be transferred from those who know to those who don't know.

Sender - the sender of communication can be a leader or a follower, but is often a leader sending facts which may influence individuals or a group. The purpose may be for self-expression, for immediate use, for influencing, or for their human-worth value.

Message - a message consists of two parts, (1) content and (2) media. The content part consists of facts, opinions, or it may be emotional. The media part is further divided into mass and individual means of communicating. The purpose of mass media messages is to enable senders to widen their influence. Messages are transferred through many different types of mass media. These include visual methods, audio methods, and audio-visual methods. Individual means of communicating are such things as the telephone, the conference, the interview, and various small group activities.

Receiver - A receiver is a person in society who acts or interacts to a message. A person is motivated in various ways by the message sent. How the person is motivated depends on his social status, the group he is present in when he bears the message, his life cycle position, and his economic status. The situation in which the message is heard may be a combination of the various factors listed above.

SUMMARY

It must be remembered that in communicating, the goal is to put thoughts into written or spoken words as clearly as possible. Good communication is necessary for individual leadership as well as for group dynamics.

STUDY QUESTIONS

1. What is communication? A definition.
2. What factors should a communication formula contain?
3. What factor in developing communication is most important? Why?
4. Do you agree or disagree with the steps in editing? Tell why you agree or disagree.
5. Which form of communicating do we use most? Does this make it most important? Why?
6. What three things are considered in group dynamics communication?

28 LISTENING

Much knowledge is acquired through listening. A good speaker possesses a very outstanding leadership quality; however, at times, listening may be <u>even more important than speaking</u>. Listening at the right time tends to win more friends and influence more people than talking.

It has been estimated that we spend 70 per cent of our time in some form of communication. Of this, 42 per cent is by listening, 32 per cent by speaking, 15 per cent by reading, and 11 per cent by writing. Developing one's listening ability will make a substantial contribution to his over-all effectiveness as a member and as a leader.

LISTENING AND OUR DAILY LIVES

The ability or need for listening begins early in life. The classroom situation, the church, or even that of receiving instructions from a policeman on how to find a certain house in a city, all rely heavily on the individual's ability to listen. The student who listens attentively in the classroom usually has little trouble in completing the assignment. The parents who listen carefully during church services are more apt to have a richer and more complete family life. The soldier who listens to his commanding officer is less apt to lose his life on the battle field. A salesman will profit well by listening at a sales conference. These are but a few examples of how listening affects our daily lives.

TRAITS OF A GOOD LISTENER

To be a good listener, one must know when to listen and when to speak-up. He must pay close attention and concentrate on what the speaker is saying. He should try to maintain eye-to-eye contact with the speaker. This is an indication of interest. A good listener can express denial, amusement, grief, annoyance, agreement, disgust, and joy without saying a word. This type of expression can invite confidence in the speaker and will also let him know if he is being listened to. A good listener will try to erase his prejudices so personal feelings do not interfere with his evaluations.

AIDS TO GOOD LISTENING

Mental alertness - It is very necessary for individuals to be in a receptive frame of mind and to be mentally awake if they expect to be able to comprehend. It is important for leaders to make it easy for a group to listen effectively.

Facilities - Such things as a meeting room which is not too hot or too cold; well-ventilated; comfortable chairs that are well-spaced; a public address system for use in large rooms are all aids to increasing listening effectiveness.

Individual responsibility - Listening improvement begins with a desire to understand the other person. A willingness to appreciate the other person. A willingness to give-up our prejudices and to give credit to what the speaker has to say.

LISTENING AND LEADERSHIP

Leaders are sometimes classed as follows: The dominator or "know-it-all-type." This type never gives the members a chance to express themselves or present their ideas. He accomplishes very little except talk. The "listening type." This type realizes that his task is to develop group thinking. He skillfully brings each member into the discussion and listens to his ideas and viewpoints. He then tactfully guides him to a conclusion.

Calvin Coolidge, past President of the United States, was considered to be one of the greatest listeners of all time.

NEGATIVE LISTENING TRAITS

Many people fail to improve their listening ability because they do not acknowledge the fact or recognize the fact that they are self-centered. That they know all the answers or that they are unwilling to accept change seems to influence their reaction to really listen. Instead, they pretend to listen while their minds wander. They may daydream, read a newspaper, whisper, look out the window, move about the room, or plan how they are going to refute what the speaker is saying. All of these may be classed as negative listening traits. Sometimes such traits may insult others and in many cases prevent individuals from becoming accepted into a group, an organization, or perhaps even to obtain employment.

Negative listening traits need first to be recognized by the individual and then positive traits should be substituted through practice.

"A GOOD LISTENER IS NOT ONLY POPULAR EVERYWHERE, BUT AFTER A WHILE HE KNOWS SOMETHING." (Wilson Misner)

STUDY QUESTIONS

1. How important is listening in our communication with others?
2. Explain how listening may affect our daily lives.
3. What are some traits of a good listener?
4. What are some aids for good listening?
5. What are some of the common negative listening traits to avoid?

29 ORAL COMMUNICATION

Oral communication is the basic criteria for effective public speaking. Being "lost for words" is generally the inability to organize thoughts in a manner so desired to express your ideas. A speaker is said to be one who has "a head to contrive, a tongue to persuade, and a hand to execute." This abiltiy can only be acquired by the study and the practice of public speaking. Until these abilities are developed, we should spend our time developing our ability to communicate orally.

Developing Oral Communication: Developing this speaking ability is a progressive transition. To be able to "crawl before a person can walk" is the type of progress that is to be developed in this transition. To develop this ability, a student could learn to take part in group and classroom discussions. An intelligent discussion can be started by asking a question. Once a barrier has been broken, a person will find himself progressively taking part in more lengthy discussions and before larger groups of people. Through extemporaneous participation, thoughts are being formulated into words for the purpose of expressing an idea.

Additional Activities for Improvement: Many activities that are available in school or organization functions can be used as a tool for self-improvement. Taking part in a panel, giving a report, a forum, or buzz sessions will provide valuable experience. These program activities are generally informal and tend to provide a relaxed atmosphere. More advanced activities may be a school assembly, school play and choral program. These activities would be a good test on the ability to perform before an audience.

WHY PEOPLE LISTEN

In communicating, a person must bear in mind some points on what makes people listen. The voice is probably the first characteristic that induces listening. The voice needs to command authority, be rich in tone, have expression and must be heard. These characteristics can be developed as a person communicates with people. To have enthusiasm will produce interest within the listening audience and at the same time aid in the command of voice and subject. To have knowledge of the subject demands respect from the listeners. This knowledge with a good voice, and with enthusiasm, will make any audience sit-up and take notice if the discussion is presented directly to the eyes of the people. Eye contact is the final prerequisite for good listening. Without eye contact, audiences have the feeling that the speaker does not have interest in their problems and is not talking to them.

SELECTING A SUBJECT

The purposes of speaking can be divided into five general objectives. These objectives are to entertain, to impress, to convince, to gain action and to provide information. Some talks may be combinations of these categories and, in general, they should be kept in mind when the subject is being selected.

The talk needs to be of interest to the person presenting it. It would be rather difficult to do an admirable job with a subject that was of no interest to the speaker.

The type of audience is a consideration in the subject to be chosen. Are they young, old, or fellow club members? Initial interest from the audience will have a big affect on the success of the presentation.

Does the talk fit the occasion? If it is National Safety Week, it would be in order to consider a talk on safety.

How much time does the speaker have to prepare and give the talk? A talk containing a lot of research material cannot be prepared on the spur of the moment. In

the same respect, short time allotments make it rather difficult to present a broad subject.

Selecting a subject of timely interest will grasp the attention of the audience much more completely than a subject of an obsolete nature. Choosing a good topic and choosing it early will contribute a great deal in having time and interest to organize ideas, locate information and to develop the self-confidence that is necessary for a successful talk.

DEVELOPING THE SPEECH

The first speech should be presented to a group that is not above the speaker's level of ability or knowledge. The most difficult talks are those given before groups that are well-versed on the topic to be covered. Being well-versed on the subject will give the speaker a feeling of authority as well as a relaxed feeling.

PARTS OF A SPEECH

The introduction, main body and the conclusion are the three major divisions of a speech. The introduction should get the attention of the audience and to explain the purpose of the presentation. Failure to attract the audience to the talk in this area will cause a lack of communication in the main portion of the talk.

The main portion of the talk is said to be the discussion or main body. The main body is to be directed at the target. Do not deviate from this area with eye or content. After the heart of the subject has been presented, the talk should work into a short conclusion. The conclusion is a brief summarization for the purpose of drawing their thoughts into the bull's eye of your target.

Developing and organizing these areas should be done with a systematic outline. With an outline it is easy to re-organize any areas of thoughts into the order that will be most effective. In the process of outlining, many thoughts and ideas are brought together and what seemingly was a shortage of material often needs to be condensed for the time allotted.

Rehearsing the talk is necessary to organize your delivery and to check the speech coherency. This should first be done in the privacy of a room. After learning the contents, the speaker may want to practice before other members of the family or to himself before a mirror.

STUDY QUESTIONS

1. What do we mean by the statement that a speaker has the "head to contrive, a tongue to persuade and a hand to execute"?
2. What is the major factor that should affect the selection of a topic?
3. For what basic reason should speech development be a progressive development?
4. How do you learn to relax before a group?
5. What hints may help a person get over the initial stage fright?

30 PERSONAL APPEARANCE

A leader is a symbol - an example to others. Poor personal appearance can almost nullify all traits of leadership. Personal appearance can be more easily changed than other abilities such as public speaking. Personal traits are an integral part of personal appearance, such as - language, manners, voice, personality, courtesy, and dependability.

SUGGESTIONS CONCERNING PERSONAL APPEARANCE

Appropriate Dress - The personal appearance of a leader depends a great deal upon the type of clothing worn for each occasion. It should be appropriate as to color and style, neatness, and general physical attractiveness. The person should feel at home in the different types of appropriate dress. This person should be at home in both formal and casual clothes. If the leader is addressing a group of workers, his dress could be casual, while one talking to a formal group should be dressed along more formal lines.

Grooming - One of the most important aspects of personal appearance is grooming. This should include keeping your hair from becoming shaggy. Your hands and nails should be clean and you should bathe at least once a day - at least partially.

PERSONAL TRAITS

The personal traits of a leader are very important. Some traits that should be developed in leaders are as follows:

Manners are very important to the leader. A leader with good manners gains the respect of his audience.

Voice is important to the leader. He or she should speak clearly and enunciate all words articulately.

Personality should be pleasant and not overbearing.

Tact is a very important aspect of leadership. A good leader should use tact in bringing out discussion among all members of a group.

Promptness should be considered by every leader and member. They should be at the meeting place at least ten minutes early. The leader should start and end the meeting on time.

Courtesy and Dependability are assets that every leader and potential leader should try to achieve.

Undesirable traits - There are also some traits which a leader should try to avoid. He should try to avoid the use of slang words and foul language. He should avoid habits such as smoking, wearing clothes that do not fit the occasion, toe-tapping, finger-pointing, and other similar habits.

A CHECK LIST FOR GOOD GROOMING

Hair

_____Is your hair neatly combed and brushed?
_____Do you shampoo your hair at least once a week?
_____Do you have an appropriate hair cut?

Hands

_____Are your hands and nails clean?
_____Are your nails short and neatly shaped?

Cleanliness

_____Do you bathe often?
_____Do you use a body deodorant?
_____Do you brush your teeth at least twice a day, especially on arising and before going to bed?
_____Are you clean-shaven?
_____Do you avoid bad breath?

Outer-Dress

_____Are your clothes clean and pressed?
_____Are your clothes conservative?
_____Are you dressed appropriately for the occasion?
_____If in uniforn, is it worn properly?

Shoes and Hosiery

_____Does your hose harmonize with your clothes?
_____Are your socks long enough to avoid exposing bare shins?
_____Are your shoes polished at all times?
_____Are the heels neat (not worn down)?
_____Do your shoes harmonize with your clothes?

Accessories

_____Does your tie harmonize with your suit?
_____Is your tie neatly knotted?
_____Do you carry a clean handkerchief?

The preceding check list is simply a guide and may be altered to fit the occasion or need.

STUDY QUESTIONS

1. What are some of the prerequisites of good grooming for a leader?

2. How can poor personal appearance hamper your effect as a leader?

3. What determines the appropriate dress for each occasion?

31 HARD WORK - A MUST IN LEADERSHIP

In attempting to accomplish any job, the most important aspect to keep in mind is that it's going to take a considerable amount of just plain hard work. Nothing is accomplished efficiently or effectively without hard work. Physically and mentally, leadership is perhaps the most demanding of all enterprises. Leaders must be prepared to work hard. However, hard work can be the object of a job being done and the effectiveness of its actual quality or purpose unseen. People often exert mental or physical capacity in doing a job when with substantial knowledge or a few intelligent observations and organization, it could have been done much easier. Also with much more proficiency.

HARD WORK AND EFFICIENCY

It is important that when a lot of hard work is applied to a job that it also be accomplished by efficient work. The following are some steps we can use in developing our ability to be efficient in hard work: Have a main objective. Plan your job in spirit and in body. Do your work on time. Get started and keep going until it is done. Concentrate on the job to be done. Don't let your mind wander to something else. Remembering and understanding what you do is important to hard work and efficiency. If you are sure of what you are doing, this becomes easier. Continually think about each step as you go. Taking notes may help you accomplish this. Never start a job without a plan. Organize your job and carry through with it. Make every hour count. A schedule of work to be done would aid you in doing this. People get their best work done by working intensively for a time, then resting or changing to something else. Have confidence in the job you're doing. If you feel

that your efforts are in vain, then your efficiency deteriorates and hard work has no further meaning. Regard emotional outbursts and lack of consideration of others as symptoms of anxieties. Control your own personal emotional outbursts also, for they only confuse your understanding of a problem. This may effect your efficiency for only a short time, however. Many people have habits of dependency and irresponsibility. These should be overcome before good hard work can be accomplished. Practice making your own decisions. Strive for improvement and perfection. Learn to recognize when you have passed your efficiency peak and be able to relax.

HARD WORK AND INEFFICIENCY

In many cases people work hard but get little accomplished because of inefficiency. The following characteristics are associated with an inefficient job when hard work can be or is the main objective in achieving the goal:

*Insufficient knowledge of the subject or job to be accomplished.
*Poor planning and organization.
*Day-dreaming while you are working.
*Letting things distract you.
*Poor analysis of work, if there is any work done at all.
*A slave attitude to a job is often a factor in poor efficiency.
*Rigidity in our feeling about a subject becomes a handicap.
*Poorly planned time is a very poor working condition.

STUDY QUESTIONS

1. What is just plain hard work?

2. What is the main objective in hard work?

3. Why concentrate on a job to be done?

4. What are some abilities you can develop in order to do good hard work?

5. What is inefficient hard work?

32 PERSONAL TRAITS

It is often said that a leader is a person with a "pleasing personality." Personality or personal traits are important and need to be cultivated; however, leadership traits are not all personal or confined solely to the individual. Another common saying is that leaders are BORN not MADE. However, as we examine some of the leader traits, it is easy to see that there are some things which must be developed. People are not born with all of these traits. Not all leadership traits fit all leaders nor do all leaders need every trait. For example, a politician requires different traits than does a research leader working with a group in atomic energy. Both are important leaders, but each has a different leadership role, with different traits involved.

POSITIVE LEADER TRAITS

Let us examine some of the traits leaders need or perhaps use under a variety of circumstances.

Humility: Perhaps if we were to single out any one personality trait to head the list it would be that of humility. A person must develop within himself a sense of humility. One should be able to start off on level ground with any given group without a feeling of arrogance or superiority, or without a pretentious attitude of wanting to make a big show for purely selfish reasons. Others can sense humility in a person quite easily and if found lacking will usually become non-receptive and non-cooperative. Humility enters into many of the so-called traits of leaders. For example, many say "speaking ability" is a "must trait." However, is the person with

a fine command of the language, a flowery voice, and theatrical showmanship really speaking with humility? Or rather, is he being somewhat arrogant and ostentatious? Perhaps this is why the people made the choice between Stephen A. Douglas and Abraham Lincoln. Lincoln was said to have been the most humble man of his time. Let us keep the trait of humility in mind as we examine some of the other leader traits.

Other Major Traits: Speaking ability cannot be over-emphasized. Leaders must cultivate not only their voices, but also their EXPRESSIVENESS and their SELF-CONFIDENCE. To speak well a person needs KNOWLEDGE of his subject in order to COMMUNICATE with his group. Leaders need to develop POISE, ENTHUSIASM, and a SENSE OF HUMOR as well as learn how to be GOOD LISTENERS. The ability to ORGANIZE and get things done is all important to leaders. Leaders must also learn to take the INITIATIVE or show the way and to have CONFIDENCE in the ability of others. Leaders must be COMPATIBLE and willing to GIVE OF THEMSELVES TO OTHERS; also, willing to put forth that EXTRA EFFORT in order to finish the job. Leaders need to develop a STRENGTH OF CONVICTION and not be afraid to take a stand or defend it. However, they should be OPEN-MINDED and willing to accept change when it is for the good of the group. Some leaders need to practice the spirit of service to others. To become PUBLIC SPIRITED as well as strong believers in DEMOCRACY AND THE DEMOCRATIC PRINCIPLES. Perhaps one other very important trait of leaders would be that of FAITH. Faith in themselves and in their work; faith in others, and faith in God. There are, of course, many other traits which could be added to any traits leaders need and should be developing.

HOW LEADER TRAITS AFFECT LEADERS

People become leaders in various ways. Some come up through the ranks and because of age and seniority finally assume the role of a leader. They are thought of as STATIC LEADERS or LAISSEZ-FAIRE ones who know all the answers but fail to develop

a working relationship with others. They are usually famous for their do-nothing term of office. Leaders who emerge out of the ranks are thought of as DYNAMIC LEADERS because of the bond they have developed while associating with those around them. Some leaders are classed as FUNCTIONARY. People follow them out of habit. They are the INSTITUTIONAL TYPE leaders. Because they hold certain positions or are wealthy, people just naturally assume that they are leaders. Some leaders are classed as ADHESIVE, IMPRESSIVE, or AUTOCRATIC LEADERS. This refers to persons who assume leadership to gain power. They use others to better themselves. Then we find NATURAL LEADERS, EXPRESSIVE LEADERS, or DEMOCRATIC LEADERS. They are the ones who have developed positive leadership traits and recognize the importance of relying on the group in order to accomplish things. Usually only the EXPRESSIVE or so-called NATURAL LEADERS have developed a good share of the positive leader traits with perhaps very few, if any, of the negative traits. All the other types of leaders we have identified possess some positive traits but have one or more serious negative traits which prevent their complete success as a leader.

NEGATIVE LEADER TRAITS

Some of the negative traits potential leaders should be aware of and work to overcome are as follows: A don't care attitude; a feeling that they must put up with people; a desire to be impressive; or a preference to work in cliques. Other negative traits include: Tendency to be arrogant; ostentatious; boorish; unprepared; discourage new ideas; fail to allow potential leadership to develop; garrulous; flamboyant; and gaucheness. These are but a few of the negative traits potential leaders need to know exist and that they have to practice to avoid just as they must practice the positive traits to keep.

STUDY QUESTIONS

1. How do personality and leader traits differ?
2. Why is humility considered an important trait?
3. What are the major positive leader traits?
4. How may traits identify kinds of leaders?
5. Which of the negative traits do you consider most important to overcome or avoid?

33 EVALUATION

An organization cannot be sure how much it is accomplishing until the effects of its program can be traced in the lives of individuals, of groups, or of communities. Evaluation occurs whenever people make value judgements about the things they do or experience.

COMPARING EVALUATION WITH MEASUREMENT

An obstacle to evaluating the human effects of leadership training is a feeling that evaluation is the same as measurement. "Anything which exists, exists in some quantity and is hence susceptible to measurement." (Scientist's Maxim) Measurement is useful in evaluating our dealings with things. Educators have devoted a great deal of time and energy to the development of tests, examinations and a vast array of other methods for evaluating the consequences of their work. When measurements are available, evaluators still have to make judgements about what the measurements mean, in terms of changing the program or keeping it as it exists. Measurements can support judgements about strengths and weaknesses in a leadership program.

EVALUATING THE PROGRAM

It is hard to determine how effective a program is unless the intended effects of the program are clearly seen and formulated. Evaluation requires answers to two questions about the leadership programs. First, what changes in people and things are expected. Second, whether these changes are taking place or whether they are not.

To answer these questions, it would be a direct aid to improving the program. There needs to be continued self-examination and evaluation as well as group evaluation. The desire to evaluate begins in some dissatisfaction with the way we carry

on activities, and the results which are achieved, or the goals that are reached. Evaluation is an essential part of the process of intelligent direction and control of human activities. One may evaluate, not to reward or punish, but to help others set more adequate goals and to discover more effective methods of achieving them.

STEPS IN EVALUATION[1]

Getting accurate information about the extent to which we are doing what we set out to do is an essential step in evaluation. Evaluation requires a number of different operations and the following seem to be essential:

*Stating the objectives of a group or organizational program in specific terms so that evidence of the degree to which objectives are being achieved can be obtained.

*Securing evidence of the degree to which objectives are being achieved.

*Securing facts about what is being done to achieve the objectives.

*Developing ideas about what factors might be helping and hindering the achievement of objectives.

*Securing evidence for and against these ideas.

*On the basis of the evidence obtained, revising ideas about what is helping and hindering the achievement of objectives.

*Developing and trying-out methods of remedying weaknesses in the program.

WHO SHOULD EVALUATE

One of the things that makes some people shrink from the idea of evaluation is the fact that evaluating is often something that a superior does to a subordinate. Much of this element of threat is removed if it is clear that the purpose of an evaluation is to improve the performance of all the persons involved in an undertaking. Then it is reasonable for everyone concerned to take an active part in the evaluation process. This is important in order to increase the sources of useful information and ideas, and to enable people to learn and change.

[1] Adult Leadership Magazine, "Evaluating Program and Performance," April, 1953, Vol.1, No. 11.

If a person takes part in the evaluation of an activity and works out plans for improving the activity, he is likely to have confidence in the evaluation process. He should understand what affects his own work has on the success of the activity, originate or accept suggestions for improving his work and be willing to make changes or to learn to make the changes that seem desirable.

WHAT DO WE EVALUATE

Evaluation procedures should be designed to measure changes in ability in terms of the objectives developed. Changes in ability are manifested in changes in phases of behavior. Phases of behavior include interests, attitudes, ideals, appreciation, desirable habits, understandings, fundamental information, problem solving, managerial skill, and self-confidence.

What the student has learned can be evaluated by the teacher, instruction group or the individual himself. Answers to the following questions about the learner will help evaluate the value of our leadership program. Has the program increased the usable fund of reliable information? Has the program changed their vocabulary? Have the students acquired new skills? Have the students learned to make reliable generalizations? Has the program altered their attitudes? "An attitude is a predisposition to act in a certain way in response to a given stimulus."

METHODS OF EVALUATION

Evaluation should be a continuous process. The evaluation process begins as a part of the program planning. The development of objectives becomes meaningful as methods and criteria for evaluating them are considered. The entire group may engage in orderly discussion to evaluate the program. Each participant may be asked to engage in self-evaluation by means of questionnaires. An evaluation committee may be developed and the standard check list could be utilized. A few questions included in a sampling survey of public opinion will determine what people think

about the program. Participation charts, check lists, evaluation forms are materials and techniques used in evaluation processes.

STUDY QUESTIONS

1. What is the difference between measurement and evaluation?
2. Why do we need evaluation?
3. What are some important steps in making an evaluation?
4. Who should make an evaluation?
5. What are we evaluating?
6. What are some methods of evaluation?

MATERIALS, OCCUPATIONAL SURVEYS,

The major purpose was to determine changes necessary in high school and post high school vocational agriculture programs of off farm agricultural occupations. Specific objectives were to -- (1) identify major occupations, (2) determine what agricultural competencies were needed, (3) cluster occupations needing similar competencies, (4) examine data for other implications, and (5) train key state leaders to use materials which were developed. Two national research coordination conferences were held and an advisory committee assisted in planning the project. Horticulture, agricultural supply, agricultural machinery, and agricultural chemicals occupational areas were selected for study. A task force was assembled to develop curriculum materials at four levels of preparation and related publications in policy making, general and program information, research, cooperative occupational experience, occupational guidance, and program organization. A national conference for state leaders presented the project and materials, and planned five area conferences. After the area conferences, the task force members completed refinement of the course outlines and instructional modules. (JM)

INTRODUCTION

The major objectives of this project were accomplished through the series of specialized publications listed on Pages 19 to 23 of this document. This publication constitutes a report of the project and the procedures used in developing these specialized publications.

Purpose

The major purpose of this project was to determine the adjustments and extensions needed in the high school and post high school curricular patterns of vocational education in agriculture to more effectively meet preparatory training needs in off-farm agricultural occupations. The summarization, interpretation, and resulting synthesis of the studies on agricultural occupations completed by twenty-six states provided the basis for determining extensions and adjustments in the curricular patterns.

Objectives

The following six specific objectives were established for the study :

1. To identify the major occupations which require competency in agriculture;

2. To determine the agricultural competencies needed by workers in these occupations;

3. To cluster the major agricultural occupations which require similar competencies;

4. To develop and refine the curricular guides and supporting materials which were most needed and feasible for the major clusters of agricultural occupations;

5. To examine the data from the studies on agricultural occupations for other implications, giving particular attention to:

   a. Programs for disadvantaged youth

   b. Projected employment opportunities in major agricultural occupations

   c. Needed adjustments in administrative and supervisory procedures

   d. Organizational structure for providing vocational education in agriculture

   e. Needed adjustments in teaching and coordinating methods

f. Pre-service and in-service education of teachers

g. Selection, placement, and follow-up of students

6. To train key state leaders in the use of the curricular guides and supporting materials.

Background

In recent years, agricultural educators and others have become increasingly aware that (1) agriculture and farming are no longer synonymous and (2) a broad complex of agricultural businesses and services have evolved which facilitate the work of the farmer and rancher in production agriculture. Consequently, leaders in agricultural education, in consort with other key groups, have undertaken an extensive research program to identify workers who require a knowledge of agriculture to perform their jobs successfully and to identify major agricultural competencies they might need. The need for such a program was further underscored by passage of the Vocational Education Act of 1963 which gave vocational education in agriculture a broadened responsibility to prepare workers ". . . in any occupation involving knowledge and skills in agricultural subjects, whether or not such occupation involves work of the farm or of the farm home. . ."

The National Center for Advanced Study and Research in Agricultural Education, in cooperation with the Agricultural Education Branch of the U. S. Office of Education, sponsored two national research coordination conferences to facilitate research in this area.

The first of these conferences was held May 27-29, 1963, with state staff members from fourteen states participating. The following were the major purposes of the conference:

1. To maximize the possibilities for coordinating and achieving commonality in the agricultural occupations studies being conducted by the several states without violating the integrity of individual state studies;

2. To provide other states with resulting materials and to encourage comparable studies.

The Second Research Coordination Conference was held at The Center on January 13-15, 1964, with state-staff representatives of twenty-one states participating. The major purposes of this conference were:

1. To develop summarization procedures which would facilitate national interpretation of data;

2. To develop guidelines for establishing and evaluating pilot programs growing out of the studies on agricultural occupations.

The rationale underlying these two conferences and this particular project was: (1) that individual states were faced with the common problem of identifying needed adjustments and modifications in their curricular offerings in vocational agriculture; and (2) that by pooling resources and talents, it would be possible to supplement and reinforce individual state efforts. Furthermore, it was apparent to agricultural educators and others, that a sustained, coordinated national effort would be more effective in serving the agricultural industry than would a series of isolated individual projects. The broader base provided by the coordinated approach minimized duplication of effort and provided individual states with greater confidence in developing their own programs than if intrastate data were utilized.

By December 15, 1964, six states had completed or were completing surveys concerning the needs for education of persons seeking employment opportunities in agricultural occupations.

METHOD

Development of the Project

In December of 1964, Dean Roy M. Kottman and members of the College of Agriculture and Home Economics of The Ohio State University, recognizing the importance and immensity of the task being undertaken, made available a short-term allocation of funds for initiating this project. On December 1, 1964, the director and the two associate project leaders began outlining activities and the schedule to be followed in attaining the project's objectives.

Dr. H. M. Hamlin, Professor Emeritus of Vocational Education, University of Illinois, assumed responsibilities as an associate project leader. Dr. Hamlin is a nationally recognized leader in vocational and technical education and a former Chairman of the Division of Vocational and Technical Education at the University of Illinois. Dr. Glenn Z. Stevens, Professor of Agricultural Education, Pennsylvania State University, and Chairman of the Research Committee of the American Vocational Association, agreed to serve as a co-leader of the project and began work in December as an associate project leader.

During the first week of December, 1964, plans were made to invite fifteen teacher educators, teachers of vocational agriculture, supervisory staff personnel, and a representative of the National Academy of Sciences to an advisory meeting with the task force personnel.

The second week in December was used by task force personnel to hold personal conferences with directors of the different state occupational need surveys, supervisors, and teacher educators in attendance at the professional meetings of the Agricultural Education Division of the American Vocational Association Convention in Minneapolis, Minnesota. Representatives of more than thirty states were contacted at this meeting.

First Project Advisory Committee Meeting

The first advisory committee meeting was held on January 14 and 15, 1965, to make recommendations to the project task force. Committee members worked on two major problems: (1) summarization of employment opportunities, and (2) direction to be taken in the development of curriculum materials.

Reactions to the following specific questions were sought from advisory committee members:

1. What procedures should be employed to effectively summarize state studies?

2. For what major occupational clusters should training be offered?

3. What are the implications for Standard Industrial Classification of Agricultural Occupations? (Prepare a master list of job titles.)

4. What are the entry opportunities in agricultural occupations?

5. What are the implications for high school and post high school curricular offerings?

6. How many programs of a given type should there be in a state?

7. What should be the relationship of educational offerings for job entry and continuing education in that program?

8. How should the length of training programs and the level of preparation be determined?

9. What should be the relationship between course offerings and occupational experience programs?

10. What consideration should be given to the problem of intensive short courses versus part-time evening classes?

11. What can be done to cope with the situation where workers are residing in locations distant to job centers?

12. Who should assist in curriculum development (agricultural education, agricultural industry, other vocational services, trade associations, manpower economics, economics, sociology, etc.)?

13. Should the concern of the committee include the total spectrum of agricultural occupations (professional to semi-skilled)?

14. What administrative requirements should be considered in program development?

    a. Organizational structure

    b. Policy formation

c. Finances

d. Setting and type of institution

15. What factors should be considered in state-wide master planning?

16. What should be the function of the teacher-training institution?

17. What kind of people should be reached with occupational education programs in agriculture?

18. What factors should be considered in program development below the baccalaureate level?

Four suggested curriculums, based on the preliminary data available from ten state studies, were presented to the advisory committee for their consideration. These suggestions were:

1. Horticulture

   a. High school level program for disadvantaged youth

   b. Continuing education for adults

2. Agri-Business

   a. Continuing education for adults on a part-time basis

   b. Cooperative occupational experience programs for high school students

3. Agri-Mechanization and Automation

   a. High school level program

4. Conservation, Forestry, Wildlife, and Recreation

   a. For the post high school preparation of technicians

It was the consensus of the advisory committee that examples of curricula in four areas at different "levels" of preparation should be developed by the project task force. The committee recommended that primary attention be given to developing a post high school program in the area of agricultural machinery. The committee also recommended fifteen items or factors to consider for the agenda of the national conference on agricultural occupations to be attended by agricultural industry representatives, head state supervisors, and teacher educators from each state. These were:

1. Report of state studies - What do the studies show?

2. Examples of varying kinds of programs already in operation.

3. Curricular patterns that might be followed.

4. Guidelines for introducing new programs.

5. Relationship of existing and future occupational programs.

6. Pilot or experimental programs which might be designed to give direction for the future.

7. Suggestions for broadening and extending present programs.

8. Problems of recruiting, selecting, and training personnel, including inservice training of present teachers.

9. Public information (dissemination - public relations).

10. Responsibilities of state staff personnel.

11. State-wide master planning.

12. Facilities needed for training programs.

13. Development of future curricular guides.

14. How to finance training programs.

15. Evaluation procedures that may be followed.

Persons who attended the January advisory meeting are listed in Appendix "B."

Selection of Key Areas and Curricular Materials to be Developed

As a result of the January advisory committee meeting, the project task force personnel agreed during the staff meeting on January 19 that the following items were basic to the project's success:

1. Occupational areas should be identified that afford the greatest number of entry opportunities.

2. These occupational areas should be further delineated into categories which have the greatest implications for agricultural training.

3. Occupational areas should be identified that are common to the greatest number of states.

4. Training programs that have a record of successful operation should be identified and utilized in developing curricular materials.

5. Materials developed should emphasize the personal attributes needed for successful job entry and tenure as well as the occupational competencies.

On January 20, 1965, the project task force decided to develop curricular materials in four separate areas and in four different levels of preparation. This was done on the basis of advisory committee recommendations and summarization data available pertaining to training needs in agricultural occupations.

Three criteria were followed in selecting these areas and levels: (1) they were to be broadly applicable to all parts of the nation; (2) they were to be typically illustrative of the type of program which could be developed by local schools with needs in these areas or in similar areas; and (3) they were not to duplicate previously completed efforts.

It was considered necessary to develop materials which would be illustrative of the type of program which could be developed for socio-economically handicapped individuals within the secondary school setting. The area of horticulture was selected for this purpose.

Preliminary data and the opinions from representatives of agricultural business on projected needs were deciding factors in the preparation of illustrative materials for a technician program in agricultural chemicals technology at the post high school level. Further, recent materials produced by other agencies in the forestry area seemed to indicate less urgent needs for development in that area. The areas and types of programs finally selected to be developed follow.

1. Horticulture - Service Occupations

   a. Grades 11 and 12 for a program at the "semi-skilled" level of preparation for students with a disadvantaged background

   b. Duration of program to be one to two years

2. Agricultural Supply - Sales and Service Occupations

   a. Grades 11 and 12 for a two-year program at the "skilled" level of preparation

   b. Post high school program at the "skilled" level of preparation which could be extended over several years

3. Agricultural Machinery - Service Occupations

   a. Post high school level cluster of training needs for five different occupational titles

   b. Duration of program could be extended over several years

4. Agricultural Chemicals Technology

   a. Post high school program in a community college setting at the technician level of preparation

   b. Duration of program to be two years

At this time basic procedures were identified to be followed by the task force in the development and preparation of instructional materials. The general procedures follow:

1. Conduct a nationwide search to identify personnel and/or programs that are capable of making contributions to the project.

2. Visit successful programs, interrogate persons associated with these programs, and prepare detailed critiques of the programs visited which could be the guidelines for the development of curricular materials. Identify problems and successful features of these programs.

3. Synthesize materials that have been assembled.

4. Critically analyze, modify, rewrite, and develop materials emphasizing the competencies identified as being necessary for successful job performance in the different state studies of occupational needs.

5. Prepare materials in depth in each area specified and include examples of a number of programs in other areas.

At the task force meeting in January, sites were selected for the five area meetings which were to follow the national meeting in May. These meetings were designed to assist the different states in planning and evaluating pilot programs in agricultural occupations. Sites tentatively selected were: Montgomery, Alabama; Denver, Colorado; Chicago or Champaign, Illinois; New York City, New York; and Seattle, Washington. Dates for these meetings were to be determined later.

Dr. Stevens was asked to contact and solicit the services of persons who could assist him in the summarization of the different state studies. February 22, 1965, was set as the meeting date for sharing data from the state studies in agricultural occupations with other vocational services, employment agencies, and industrial personnel to secure their reactions and comments.

Related publications

As the project evolved, it became apparent that there was a need for an additional set of publications which would complement the four sets of curricular materials. The titles for the accompanying publications had not been determined, but the general content would be developed to:

1. Provide information to laymen on the need, pioneering achievements, progress of individuals who have been so trained, the demand for trained personnel, the scope of the field, conditions needed for success, and the cooperation with different industries and educational agencies. This publication would be of value to employers of workers in agricultural occupations, state and national legislators, editors, and others important in shaping public opinion.

2. Adapt portions of the off-farm agricultural occupations materials for use by the newspapers, radio, and television.

3. Assist state-level policy-making bodies, state superintendents, state department personnel, college and university administrators, and college personnel in occupational education.

4. Assist state boards and administrators in local and area schools with the policy and administrative decisions to be made in launching new programs.

5. Provide material for teachers in local and area schools to assist them in organizing and conducting programs in off-farm agricultural occupations, especially the occupational experience phase of such programs.

6. Report the research findings of cooperating states in the area of off-farm agricultural occupations.

7. Organize the research data into possible instructional areas and provide occupational guidance information for teachers and counselors.

At the end of January, 1965, steps were taken to identify persons in the different states who would be available to work at The Center with the project leaders in summarizing data from state studies and preparing the developmental materials outlined above.

Staff Personnel

The project was funded on February 15, 1965, permitting the project leaders to complete arrangements for task force personnel. Dr. George Luster, Associate Professor of Vocational Education, University of Kentucky, began working on March 1, on the overall development of curricular materials. This included working with task force personnel to develop a format for the materials and to coordinate the instructional materials development. He later developed specific materials in the agricultural supply - sales and service occupational area.

Mr. Alan Kahler, former teacher of vocational agriculture in Nebraska and teaching assistant in the Department of Agricultural Education at Iowa State University, came to the Project on March 1, 1965. His primary responsibility was to develop curricular materials in agricultural machinery -

service occupations at the post high school level. Mr. Howard Nowels, teacher of vocational agriculture in Fremont, Ohio, began working March 1, developing materials for the area of agricultural supply - sales and service occupations. Mr. Nowels first concentrated his efforts on the high school programs. Mr. James Utzinger, a teacher of vocational horticulture in the Grove City, Ohio, schools began working on March 22, to develop the curricular materials in horticulture - service occupations. He was assisted during the month of July by Mr. Peter J. Wotoweic, teacher of vocational horticulture at West Technical High School, Cleveland, Ohio. Mr. William Becker, teacher of vocational agriculture at Janesville, Wisconsin, had developed a program in off-farm occupations in cooperation with the Department of Agricultural and Extension Education of the University of Wisconsin. Mr. Becker began working with Mr. Nowels in the area of agricultural supply on April 5, 1965. All of these men were recognized as outstanding teachers and had experience in the specific area in which they were developing materials.

Mr. Donald Seaman, graduate student in agricultural education at The Ohio State University, began assisting Dr. Stevens on April 1 with the summarization of data from the different state studies. Mr. William Stevenson, Oklahoma State University staff member and director of a state occupational needs study, spent two months, beginning June 1, working with Dr. Stevens summarizing and analyzing occupational data from the different states.

Mr. Nowels became ill and upon doctors' advice resigned from the project on April 30. Mr. Becker then assumed primary responsibility for the area of agricultural supply and was assisted by Dr. Julius H. Lintner, former assistant state supervisor of agricultural education in Ohio, who began working on the project on May 1.

Dr. Jerry J. Halterman, Dean of Agriculture, Chico State College, Chico, California, was responsible for developing materials in agricultural chemicals technology.

Mr. Harold Anderson, formerly Assistant Professor of Agricultural Education, Colorado State University, began working July 1, on materials for planning and conducting occupational experience programs in off-farm agriculture.

Mr. Ramsey M. Groves, formerly teacher of vocational agriculture in New Mexico and a doctoral candidate at The Ohio State University, worked part-time on the total project.

Mr. Robert V. Kerwood, formerly Assistant Professor of Agricultural Education, West Virginia University, and currently a doctoral candidate and Research Associate at The Center, assisted in coordinating the final publication of all materials in the project.

Dr. Glenn Stevens, Professor of Agricultural Education at Pennsylvania State University, assumed the major responsibility for the publication in Guidance for Off-Farm Agriculture.

In August, 1965, Dr. James W. Hensel, formerly Assistant Professor, University of Wisconsin, joined the professional staff at The Center as Specialist in Agricultural Education. He assumed the role of coordinating the final publication of the Agricultural Chemicals Technology and Guidance materials and of completing the final requirements of the project grant.

Dr. James E. Christiansen, Assistant Professor, University of Florida, worked as a project staff member during his final year of graduate work at The Ohio State University. His major responsibilities were in preparing the final drafts for publication, based on the technical and editorial reviews. Dr. Christiansen also wrote the original draft for the final report of the project and served as a reviewer for the Agricultural Chemicals Technology publication.

In addition to the task force personnel, other persons served as consultants or prepared specific materials for the project. These persons and their areas of specific contributions were:

Dr. Homer V. Judge Department of Agricultural Education University of Massachusetts Amherst, Massachusetts	Summarization of State Data March 15-20
Robert E. Steffy Department of Agricultural Education Pennsylvania State University University Park, Pennsylvania	Agricultural Supply-Salesmanship March 22-26
Dr. William Hull Department of Agricultural Education Pennsylvania State University University Park, Pennsylvania	Agricultural Supply-Human Relations March 28-April 9
Dr. J. R. Warmbrod Department of Vocational Education University of Illinois Urbana, Illinois	Agricultural Supply April 12-22
V. B. Hairr, State Supervisor Agricultural Education State Department of Public Instruction Education Building Raleigh, North Carolina	Agricultural Machinery April 12-16
Dr. Le Roy Barker Professor of Agronomy Chico State College Chico, California	Agricultural Chemicals Technology
Dr. H. Dean McNeilly Chairman, Department of Agriculture Delta College Stockton, California	Agricultural Chemicals Technology

Dr. E. D. DeRemer, Director Special Agriculture Programs Northeastern Junior College Sterling, Colorado	Agricultural Chemicals Technology
Dr. Jordon Smith Professor of Agronomy Chico State College Chico, California	Agricultural Chemicals Technology
Dr. E. A. Tarone Chairman, Department of Agriculture Modesto Junior College Modesto, California	Agricultural Chemicals Technology
Earl Scott MDTA Instructor Jefferson City Schools Jefferson, Ohio	Agricultural Machinery Tractor Repair July 19-28
Martin Rehmert Teacher of Vocational Agriculture New Knoxville, Ohio	Agricultural Machinery Metal Fusion August 2-6
Robert H. White Graduate Assistant The Ohio State University Columbus, Ohio	Agricultural Supply Farm Petroleum September 14-28
C. G. Dawson, Consultant North Carolina Department of Community Colleges Department of Public Instruction Raleigh, North Carolina	Program Visitation, Analysis, and Preparation of In-depth Critiques for Project Staff Members
Linwood Bailey, Manpower Coordinator Defense Activity Staff Policy and Program Appraisal Division Agricultural Stabilization and Conservation Service U. S. Department of Agriculture Washington, D. C.	Guidance
Emanuel Weinstein Occupational Analyst Program Services Branch U. S. Office of Education Washington, D. C.	Guidance

It will be noted that the project staff, including those actively involved and contributing to the publication series, included staff members from fifteen states.

Second Project Advisory Committee Meeting

As task force efforts progressed, it was thought advantageous to again invite people knowledgeable in the area of off-farm agricultural occupations to an advisory meeting on March 15, 1965. The purpose of this meeting was to test the plans, proposals, and alternatives suggested by staff with the advisory group. It was hoped that the group would offer comments and suggestions concerning the plans for the development of materials for programs of off-farm occupational education that were being considered by task force personnel. The list of persons attending this advisory meeting is included as Appendix "C." The group included representatives of agricultural machinery dealerships, teacher educators working with programs in depressed areas of the deep South, representative of a curricular materials service, representatives from the division of vocational guidance in a state department of education, a personnel development director for a large Farm Bureau cooperative, a teacher educator from the field of distributive education, and the Chief, Agricultural Occupations, United States Office of Education.

The persons attending this advisory meeting provided task force personnel with specific direction in the program development and curricular aspects of the project. The general format of the curricular materials proposed by task force personnel was accepted and endorsed by this advisory group. A specific outgrowth of the advisory meeting was the design for a national advisory meeting to be held in April.

Another outgrowth of this meeting was the establishment of channels of communication between persons in education and persons representing different power structures in agricultural business and industries. The two-way line of communications established here paved the way for increased understanding and appreciation of mutual concerns in both the national meetings and area meetings which followed. These contacts with people from industry reinforced and accentuated the need for establishing programs in off-farm occupations.

Activities Prior to April Advisory Meeting

During the month of March, dates and locations were established for five regional conferences on developing programs for off-farm agricultural occupations to be held during the months of May and June. It was necessary to shift the southern area conference from Montgomery, Alabama, to Atlanta, Georgia. These conferences were to serve state staff and local level personnel who would be developing new types of programs in off-farm occupations. During March, most of the project staff personnel responsible for developing curricular materials began their work. Schedules were established for visits to key programs in off-farm occupations across the nation. Among the programs visited during March and the following months were:

Agricultural Supply	Forsyth Technical Institute Winston Salem, North Carolina

Agricultural Supply	Reidland High School Paducah, Kentucky
Agricultural Supply	Springfield Senior High School Springfield, Ohio
Agricultural Supply and Agricultural Chemicals Technology	Northeastern Junior College Sterling, Colorado
Horticulture	Camden County Joint Vocational School Merchantville, New Jersey
Horticulture	Rockland County Center of Technology and Education West Nyack, New York
Horticulture	Philadelphia High School for Horticulture Philadelphia, Pennsylvania
Agricultural Machinery	Alexandria Area Technical School Alexandria, Minnesota
Agricultural Machinery	Jefferson High School Jefferson, Ohio

These programs were identified on the basis of recommendations made by persons acquainted with the needs in off-farm agricultural occupations and emerging programs. In addition, an examination of materials concerning these programs prepared by people involved in them served as a basis for selection. Materials were graciously furnished to the project staff by persons conducting the programs.

Also, during March, decisions were made concerning the length of the programs for which materials were to be developed on the basis of the preliminary data already received and summarized from state occupational studies. In analyzing data from the different states, task force personnel were reminded that a lack of comparative data made the process of analyzing information for nation-wide application extremely difficult. It was obvious that it would take longer than had been originally anticipated to develop usable conclusions based upon these data. Based upon factor analysis and extrapolation, common elements from the developmental research studies were drawn and synthesized for use by project personnel.

Priorities were established for the development of the specific materials which were to be outgrowths of this project. High priority was given to the preparation of the publication pertaining to the research findings of the various states. High priority was also given to the development of those materials which would serve as guidelines in policy and administrative decisions for persons undertaking new programs in off-farm occupations. It was necessary to put greater emphasis on

these program developmental materials because people in schools across the nation would need this type of assistance before they could intelligently plan new programs and utilize the instructional materials being developed. It was also necessary during this period to develop working definitions of terms such as "technical education," "vocational skills," and "occupational education" to furnish a common ground of understanding.

National Advisory Meeting for Developing Programs of Education in Off-Farm Agricultural Occupations

On April 5 and 6, 1965, forty-one persons from across the nation met on the campus of The Ohio State University as a national project advisory committee to give direction to the development of educational programs in this area. These people represented vocational agriculture, trade associations, other vocational services, different institutional settings, supporting disciplines, and business and industrial organizations directly associated with off-farm agriculture. Representatives from sociology, rural sociology, agricultural economics, teacher education, state supervisory staffs, community colleges, land grant colleges, and area vocational schools attended this conference. A complete list of those who attended has been included as Appendix "D."

The persons participating in this conference were charged with providing task force personnel with specific counsel and suggestions to be considered in preparing program development and curriculum materials. Among the items presented by the advisory committee to the task force for consideration were the following:

1. Materials to be developed must consider the age and maturity level required by prospective employers.

2. There is a need for more programs at the post high school level.

3. Successful programs cannot be developed unless cooperation with the off-farm business or industries concerned is obtained.

4. A joint responsibility exists between industry and education for the in-service education or retraining of present employees. Because more vertical integration is taking place among companies engaged in off-farm agriculture, fewer companies with larger numbers of employees needing more uniform programs of pre-employment and in-service education will result.

5. Programs such as those proposed cannot operate effectively unless local or area advisory councils are utilized to help guide and direct the program.

6. Attention should be given to procedures for updating the materials developed by this particular project.

7. In some instances, it is necessary to seek out the advice of persons in those businesses and industries in off-farm occupational areas who are on the "growing edge," and are facing problems in training personnel that the vast majority of such businesses have not yet faced.

8. There is a need for continuing, systematic research on both the immediate employment and long-range projected needs.

9. Schools have a responsibility for teaching occupational "fundamentals"; industry has the responsibility for moving men and women ahead within the job and organization.

10. The need for competency in communications skills, such as reading, writing, working with people (human relations), and developing proper personal attitudes, was also expressed by some business and industry people attending the conference.

11. Duplication among agencies in providing off-farm occupational training programs needs to be limited, thereby resulting in increased savings and improved educational effectiveness.

12. More precise and comprehensive terminology is needed by people developing these programs so that they are universally understood.

13. School people present expressed the viewpoint that "we expect industry to absorb our product, therefore we must have a product that industry wants. Consequently, we must expect industry to explain what skills and abilities are needed for entry as well as advancement in occupations."

14. The programs being established will not be of fullest value if the students enrolled in them do not secure adequate vocational guidance. Consequently, vocational guidance counselors and teachers working with individual students need to: (a) determine interests, (b) expand on knowledge about jobs available, (c) note the students' individual abilities, and (d) explore different occupations for which a person would be best fitted.

15. While being concerned with working with business and industry, it is imperative that persons planning such programs not overlook the possibility of cooperating with other vocational and educational services. The Department of Labor, employment security agencies, the Agricultural Extension Service, four-year educational institutions, privately operated educational institutions, and the general public are all vitally concerned with off-farm occupational education.

16. The advisory meeting members endorsed the format for materials and general plan of operation being followed in the project.

17. The problem of low-entry wages in some agricultural occupations was identified as a deterrent to program development. The opinion was expressed that entry wages should improve as the qualifications of entry workers improve.

Activities Prior to National Conferences on Off-Farm Agricultural Occupations

At the conclusion of the April advisory committee conference, selected supervisors and teacher educators stayed to assist staff members in planning the National Conference on Off-Farm Agricultural Occupations. These men also assumed leadership roles in the May conference.

After the April meeting, project task force personnel standardized course titles by description and by areas. It was decided to categorize job titles. By the beginning of May complete summarization data had been received from fifteen states.

Programs in operation in the different states were evaluated as task force personnel began preparing program development and curriculum materials. The time between the April conference and the May national conference was devoted to preparation of project materials in all areas. By the time the national conference was held in May, preliminary program development materials concerning policies and administrative decisions in off-farm programs as well as a tentative summary of research findings had been completed. Instructional materials had been prepared in tentative form for approximately 40 percent of the modules in horticulture, agricultural supply, and agricultural machinery. Content in the area of agricultural chemicals technology had been outlined.

The National Conference on Off-Farm Agricultural Occupations

From May 4 to 7, 1965, 153 individuals from 49 states, not including task force personnel, attended a national conference on off-farm agricultural occupations on the campus of The Ohio State University. A complete list of the persons attending appears as Appendix "E." The conference was developed primarily for teacher educators and state supervisory personnel in agricultural education. Representatives from agricultural business and industry, state colleges and universities, the U. S. Office of Education, area vocational schools, community colleges, state employment services, and state departments of public instruction also attended this conference.

The primary purposes of the conference were:

1. To present to personnel from the respective states an outline for developing new programs in off-farm agricultural occupations.

2. To show the nation-wide need for such programs.

3. To present the preliminary materials pertaining to development of such programs as well as illustrative curricular materials already developed by project personnel.

4. To plan five area meetings which would focus on the development of local pilot programs.

In the evaluation of this conference, the persons attending reflected an interest in and a need for developing such programs in their respective states. They also sought specific help in establishing such programs, especially in states which had small state staffs. One common feeling expressed was that the conference itself should have been held a year earlier.

In analyzing the evaluation instruments returned by conference participants, it was interesting to note that some persons had not been aware, until this conference, of the willingness of business and industry to cooperate with education in establishing needed programs. It was the judgment of the task force that some conference participants were ignoring study data and viewing needed developments in this area in light of modifying existing traditional programs rather than developing new or parallel programs focusing primarily on off-farm agricultural occupations. That is to say, some apparently felt that "some instruction" could be injected into certain years of the present production-oriented program and do the job that needed to be done. The task force, recognizing the impact of the data, the training requirements for present and emerging occupations, and counsel from agricultural occupations employers, resolved to place increasing emphasis during the remainder of the project on the development of programs devoted primarily, if not exclusively, to off-farm agricultural occupations.

In summarizing the comments of the participants, task force personnel expressed concern that materials being developed for this purpose would be "prostituted" by being "inserted in" existing programs in many states. Developing occupational competency in off-farm occupations requires a complete, coordinated program of education which is tailored for occupational entry. This type of program cannot be developed by adding a module or two to an existing traditional program. To help foster this idea of developing a complete program in any given area, task force personnel decided that the curriculum materials now growing out of the work of the project would be sold to the states only as complete sets.

Conference participants discussed extensively the following leadership tasks of state staff personnel in developing programs in off-farm agricultural occupations: (1) determining administrative responsibility; (2) changing existing programs; (3) developing and evaluating departmental programs; (4) providing qualified personnel for such work; (5) providing occupational experience; and (6) providing vocational education in agriculture to those not benefiting from the regular program. In addition, time was spent by state staff personnel on the problem of the establishment of priorities within states in developing this type of program.

Activities Subsequent to National Conference on Off-Farm Occupations

The two weeks following the national conference at Ohio State were spent by task force personnel in the preparation of project materials and in preparation for five area meetings on off-farm occupations to be held across the country. The rationale among project staff personnel was that time spent in activities which helped the dissemination of materials and the resulting establishment of local pilot programs was time well spent. These meetings took place in New York City on May 17-19, 1965; Chicago on May 24-26; Pullman, Washington on June 2-4; Denver, Colorado on June 9-11, 1965; and Atlanta, Georgia on June 21-23, 1965.

Area Meetings

While the National Conference in Ohio had focused attention on responsibilities and activities of state staff personnel in the respective states, the area meetings focused on the responsibilities and activities in which local school administrative officers, local boards, vocational coordinators, vocational teachers, and lay personnel could engage to determine the needs for initiating such programs at the local level. The role of state staffs in initiating pilot programs was also included.

A total of 332 persons, excluding task force personnel, attended area meetings. Thirty percent of these persons were local teachers, 50 percent of those attending were the state staff personnel, who, by and large, would be responsible for providing guidance for these programs in their respective states. Representatives from agricultural industries, other vocational services, and educational institutions in the different areas attended these meetings. The roster of those attending area meetings is attached as Appendix "F."

The Development of Curricular and Supporting Materials

Following the last area meeting, the task force personnel devoted their energies to completing the curricular and program development materials. One of the major objectives of the project was to develop curricular guides and supporting materials which were determined to be most needed in the area of off-farm agricultural occupations. Therefore, the completion of a series of publications was given high priority by the task force.

The following publications were prepared during the summer of 1965 to assist educators in developing programs in off-farm agricultural occupations:

1. Policy and Administrative Decisions Needed When Introducing Vocational and Technical Education in Agriculture for Off-Farm Occupations (for boards and administrators of local schools, area schools, and colleges)

2. Vocational and Technical Education in Agriculture for Off-Farm Occupations (for counselors, teachers, board members, and administrators at all levels)

3. Summary of Research Findings in Off-Farm Agricultural Occupations

4. Planning and Conducting Cooperative Occupational Experience in Off-Farm Agriculture

5. Occupational Guidance for Off-Farm Agriculture (for teachers, guidance counselors, and students)

6. Organizing to Provide Agricultural Education for Off-Farm Occupations (of primary value to state staffs when working with groups planning programs in off-farm occupations. This consists of 18 mimeographed sheets from which transparencies can be made.)

In addition, curricular materials were developed by the task force to assist teachers in developing courses in four subject areas:

A. Agricultural Machinery - Service Occupations

These materials were created for a course designed to develop at the post high school level the competence needed for occupational entry and advancement in service occupations in agricultural machinery dealerships.

The complete set of curricular materials in this area consists of a detailed course outline including suggestions for developing this course as well as sixteen instructional modules. These modules are as follows:

1. Organization and Management of Agricultural Machinery Dealerships

2. Agricultural Machinery Service Department Operating Procedures

3. Agricultural Machinery Parts Department Operating Procedures

4. Agricultural Salesmanship

5. Human Relations in Agricultural Occupations

6. Metal Fusion and Fabrication Welding

7. Agricultural Machinery Assembly and Lubrication

8. Mechanical Power Transfer Systems

9. Hydraulic Power Transfer Systems

10. Adjustment, Maintenance, and Repair of Tillage, Planting, Spraying, and Fertilizing Machinery

11. Adjustment, Maintenance, and Repair of Crop Harvesting Machinery

12. Adjustment, Maintenance, and Repair of Small Gasoline Engines

13. Tractor Tune-up and Maintenance

14. Gasoline Tractor Engine Systems

15. Diesel Engine Systems

16. Tractor Repair

B. Agricultural Supply - Sales and Service Occupations

These materials have been prepared for a course at the high school level to prepare high school students for successful job entry in retail businesses that sell agricultural supplies and services. The course is largely limited to preparing students to sell production agricultural supplies, such as feeds, seeds, fertilizer, chemicals, and small items and equipment of a similar use. The course is not intended to prepare workers to sell major agricultural items or supplies such as farm machinery, tractors, heavy building materials.

The complete set of curricular materials in this area consists of a detailed course outline including suggestions for developing this course as well as twelve instructional modules. These modules are as follows:

1. Career Opportunities in Agricultural Sales and Service

2. Orientation to the Supervised Occupational Experience Program

3. Human Relations in Agricultural Occupations

4. Agricultural Salesmanship

5. Organizations and Functions of Agricultural Businesses

6. Business Procedures

7. Feeds - Sales and Service

8. Crop, Lawn, and Garden Seeds - Sales and Service

9. Fertilizers - Sales and Service

10. Agricultural Chemicals - Sales and Service

11. Petroleum and Petroleum Products - Sales and Service

12. Miscellaneous Agricultural Supplies and Small Equipment - Sales and Service

C. Horticulture - Service Occupations

These materials have been prepared for a course at the high school level to develop the degree of competence needed for occupational entry as service workers in such establishments as nurseries, garden centers, greenhouses, golf courses, and grounds maintenance departments.

The complete set of curricular materials in this area consists of a detailed course outline including suggestions for developing this course as well as twelve instructional modules. These modules are as follows:

1. Exploring Occupational Opportunities in Ornamental Horticulture

2. Identifying Horticultural Plants

3. Propagating Horticultural Plants

4. Growing Horticultural Plants

5. Using Soil and Other Plant Growing Media Effectively

6. Recognizing and Controlling Plant Pests

7. Constructing, Maintaining, and Using Plant Growing Structures

8. Agricultural Salesmanship

9. Establishing and Caring for Lawns and Turf

10. Operating, Repairing, and Maintaining Small Power Equipment

11. Using and Caring for Ornamental Plant Materials and Landscape Structures

12. Human Relations in Agricultural Occupations

D. Agricultural Chemicals Technology

These materials were designed to provide an intensive two-year full-time program of study and work experience for students in agricultural chemicals technology. The courses in this post high school program are planned and organized to provide the chemical, biological, business, mathematical, and agricultural theories combined with procedural and technical skills involved in their application to the broad field of agriculture.

A complete set of curricular materials in this area include a suggested two-year post high school curriculum and course outlines and eight instructional modules. These modules are as follows:

1. The Use of Chemicals as Fertilizers

2. The Use of Chemicals as Insecticides - Plants

3. The Use of Chemicals as Soil Additives

4. The Use of Chemicals as Fungicides, Bactericides and Nematocides

5. The Use of Chemicals to Control Field Rodents and Other Predators

6. The Use of Chemicals as Herbicides

7. The Use of Chemicals in the Field of Farm Animal Health (Nutrition, Entomology, Pathology)

8. The Use of Chemicals as Plant Regulators

In the development of instructional materials and supporting publications, a general procedure was followed to maximize validity and acceptance. Drafts of materials were prepared based on findings of the agricultural occupations studies, site visits to outstanding programs, and the best available materials. These drafts were submitted to vocational education teachers experienced in the specific area, to subject matter specialists in universities and industry, and to prospective employers. These technical reviews were then refined and synthesized before a final editorial review was given the publication.

Copies of all publications were mailed to head state supervisors and head teacher educators in agricultural education throughout the United States. Vocational agriculture teachers, vocational educators, subject matter specialists, agricultural businessmen, and others who reviewed the materials for accuracy and appropriateness of content also received copies of the publications. Twenty-five copies of each publication were mailed to the Office of Education to fulfill contract obligations.

Evaluating the Project

Several techniques were utilized to evaluate the worth of the overall project.

1. Participants in the May, 1965, national conference were asked to evaluate the strengths and weaknesses of the project in detail.

2. Evaluation sheets were included with each set of materials distributed to persons in the respective states; these sheets were to be returned by the user after completion of each module taught or after using each publication.

3. Plans are underway for monitoring and evaluating pilot programs in operation which are using the materials developed as an outgrowth of this project.

4. During the week of June 27 - 30, 1966, The Center sponsored a National Seminar on Evaluation and Program Planning in Agricultural Education. A significant portion of the seminar was devoted to the evaluation of the off-farm agricultural occupations project materials. One of the major purposes of the seminar, supported by the Sears-Roebuck Foundation, was to provide an opportunity for state leaders in agricultural education and representatives of other vocational services to pool their resources and thinking in planning for effective measurement and evaluation of pilot programs in off-farm agricultural occupations. The authors of each of the several publications acted as chairmen of small group discussions during the seminar for the purpose of gaining firsthand information from teacher educators and supervisors concerning the value and utility of the materials.

5. An extensive review of materials was made by persons qualified in the respective areas of specialization. These reviewers provided much valuable assistance and guidance in the development of materials resulting from this project. Those persons who served as reviewers of materials are listed as Appendix "A."

Strengths of the Project

1. States were provided assistance in completing and synthesizing their studies of agricultural occupations.

2. Persons from disciplines outside agriculture who could bring fresh, and, hopefully, unbiased viewpoints were involved to give direction to the programs to be undertaken. This involvement took place at the advisory committee meetings, during the National Conference on Off-Farm Occupations, and at the five area meetings. Persons were involved from the areas of sociology, rural sociology, agricultural economics, economics, manpower

economics, the National Academy of Sciences, community colleges, four-year colleges and universities, area vocational schools, technical institutes, and agricultural industries representing private concerns or trade associations.

3. Area meetings with primary emphasis on the development of local and area pilot programs permitted the active involvement of persons at the "action" level who would not have been able to benefit as quickly if they had been left to their own devices, especially as it permitted reduction of the time lag between awareness and decision making.

4. An awareness was created on the part of state staff personnel that cooperation and assistance can be secured in establishing these programs from other educational areas and from agricultural industry or businesses.

5. The national conference and the following area meetings provided a setting for the face-to-face interchange of ideas and discussions of mutual problems in developing new programs which would not have been possible in another manner.

6. One outcome of the project was the ability to entice personnel uniquely qualified in their respective fields to join the task force on a short-term basis to prepare specific materials. Also, the ability of the task force personnel to utilize extensively the experience of persons in agricultural businesses and industries who were aware of and were facing the problems in the preparation of employees contributed to the validity of the materials produced. The wholehearted cooperation provided by other vocational services permitted task force personnel to benefit from their experience and avoid previous errors. Another strength of the project was the opportunity to project efforts at an accelerated rate on a national basis.

7. Interstate cooperation was fostered in the development of instructional materials and supporting activities.

8. Materials developed were based on the recent research findings and advice from national leaders in agricultural industry who were able to project employment requirements.

Problems Associated with the Project

1. The lateness in securing project approval for funding from the Office of Education delayed the entire project schedule and made it difficult to have materials ready for the 1965-1966 school year.

2. Limitations of time and resources made it impossible to identify and evaluate all on-going programs in off-farm agricultural occupations.

3. Within this project it would have been desirable to have resources to contract with states and local districts for the conducting of pilot programs to carefully field test the instructional materials and supporting publications.

4. If the entire project schedule could have been advanced through earlier funding and accelerated efforts, it would have been desirable to have conducted some extensive workshops for state staff personnel who, in turn, would have been responsible for conducting workshops for teachers initiating programs in their states. This was accomplished to some degree on an informal basis, but not to the degree desired. Such workshops could also have addressed themselves to the operational level problems of involving other vocational services in such programs.

5. States were not able to maintain their schedules for completing research projects; hence, it was impossible to utilize all state research data in the synthesis.

6. Despite the efforts exerted through the two research coordination conferences, individual state project designs varied, therefore, contributing to the problem of developing comparative data.

SUMMARY

The major objectives of this project were accomplished through the series of specialized publications listed on Pages 19 to 23 of this document. This publication constitutes a report of the project and the procedures used in developing these specialized publications.

The major purpose of this project was to determine the adjustments and extensions needed in the high school and post high school curricular patterns of vocational education in agriculture to more effectively meet preparatory training needs in off-farm agricultural occupations. The summarization, interpretation, and resulting synthesis of the studies on agricultural occupations completed by twenty-six states provided the basis for determining extensions and adjustments in the curricular patterns.

Six specific objectives were established for the study. These were:

1. To identify the major occupations which require competency in agriculture.

2. To determine the agricultural competencies needed by workers in these occupations.

3. To cluster the major agricultural occupations which require similar competencies.

4. To develop and refine the curricular guides and supporting materials which were most needed and feasible for the major clusters of agricultural occupations.

5. To examine the data from the studies on agricultural occupations for other implications, giving particular attention to:

   a. Programs for disadvantaged youth.

   b. Projected employment opportunities in major agricultural occupations.

   c. Needed adjustments in administrative and supervisory procedures.

   d. Organizational structure for providing vocational education in agriculture.

   e. Needed adjustments in teaching and coordinating methods.

   f. Pre-service and in-service education of teachers.

   g. Selection, placement, and follow-up of students.

6. To train key state leaders in the use of the curricular guides and supporting materials.

A task force of educational leaders was assembled at The Center early in 1965 to work toward the accomplishment of the objectives. Advisory Committee meetings were held with representatives of agricultural business and industry, teacher educators, and state department personnel to gather suggestions concerning the development of materials for programs in off-farm agricultural occupations. The general format of the curricular materials was endorsed by this advisory group. Various off-farm agricultural programs in operation in the states were evaluated by the task force personnel as they began preparing curriculum materials.

In May, 1965, 153 individuals from forty-nine states attended a national conference at The Ohio State University to discuss the various phases of the off-farm agricultural occupations project. The primary purposes of the conference were:

1. To present to personnel from the respective states an outline for developing new programs in off-farm agricultural occupations;

2. To show the nation-wide need for such programs;

3. To present the preliminary materials pertaining to development of such programs as well as illustrative curricular materials developed by project personnel;

4. To plan five area meetings which would focus on the development of local pilot programs.

Following the national conference at The Ohio State University, the task force personnel prepared project materials for five area meetings on off-farm occupations to be held during May and June in New York City, New York; Chicago, Illinois; Pullman, Washington; Atlanta, Georgia; and Denver, Colorado. The primary purpose of the area meetings was to focus attention on the responsibilities and activities of local administrative officers, school boards, teachers, and the general public in initiating programs in the off-farm occupations. The meetings were attended by a total of 332 persons who also assisted in revising the project materials to make them more effective for their area.

After the last area meeting, the task force personnel devoted their energies to completing the curricular and program development materials. One of the major objectives of the project was to develop curricular guides and supporting materials which were determined to be most needed in the area of off-farm agricultural occupations. Therefore, the completion of a series of publications was given high priority by the task force.

The following publications were prepared during the summer of 1965 to assist educators in developing programs in off-farm agricultural occupations:

1. Policy and Administrative Decisions Needed When Introducing Vocational and Technical Education in Agriculture for Off-Farm Occupations (for boards and administrators of local schools, area schools, and colleges)

2. Vocational and Technical Education in Agriculture for Off-Farm Occupations (for counselors, teachers, board members, and administrators at all levels)

3. Summary of Research Findings in Off-Farm Agricultural Occupations

4. Planning and Conducting Cooperative Occupational Experience in Off-Farm Agriculture

5. Occupational Guidance for Off-Farm Agriculture (for teachers, guidance counselors, and students)

6. Organizing to Provide Agricultural Education for Off-Farm Occupations (of primary value to state staffs when working with groups planning programs in off-farm occupations. This consists of 18 mimeographed sheets from which transparencies can be made.)

In addition, curricular materials were developed by the task force to assist teachers in developing courses in four subject areas:

1. Agricultural Machinery - Service Occupations

   These materials were created for a course designed to develop the competence needed at the post high school level for occupational entry and advancement in service occupations in agricultural machinery dealerships.

   The complete set of curricular materials in this area consists of a detailed course outline including suggestions for developing this course as well as sixteen instructional modules.

2. Agricultural Supply - Sales and Service Occupations

   These materials were prepared for a course at the high school level to prepare high school students for successful entry in retail businesses that sell agricultural supplies and services. The course was largely limited to preparing students to sell production agricultural supplies, such as feeds, seeds, fertilizer, chemicals, and small items and equipment of a similar use.

   The complete set of curricular materials in this area consisted of a detailed course outline including suggestions for developing this course as well as twelve instructional modules.

3. Horticulture - Service Occupations

   These materials were prepared for a course at the high school level developing the degree of competence needed for occupational entry as service workers in such establishments as nurseries, garden centers, greenhouses, golf courses, and grounds maintenance departments.

   The complete set of curricular materials in this area consisted of a detailed course outline including suggestions for developing this course as well as twelve instructional modules.

4. Agricultural Chemicals Technology

   These materials were designed to provide an intensive two-year full-time program of study and work experience education for students in agricultural chemicals technology. The courses in this post high school program were planned and organized to provide the chemical, biological, business, mathematical, and agricultural theories combined with procedural and technical skills involved in their application to the broad field of agriculture.

A complete set of curricular materials in this area included a suggested two-year post high school curriculum and course outline and eight instructional modules.

Copies of all publications were mailed to head state supervisors and head teacher educators in agricultural education throughout the United States. Vocational agriculture teachers, subject matter specialists, agricultural businessmen, and others who reviewed the materials for accuracy and appropriateness of content also received copies of the publications. Twenty-five copies of each publication were mailed to the Office of Education to fulfill contract obligations.

APPENDIXES

APPENDIX "A"

Evaluators of Materials Prepared by
Task Force Personnel

The following persons evaluated selected portions of the program developmental and curricular materials prepared within their area of specialization. Their comments and constructive criticisms aided materially in strengthening the value of these materials.

Policy and Administrative Decisions
Needed When Introducing
Vocational and Technical Education in Agriculture
For Off-Farm Occupations

Harry G. Beard	Associate Professor of Education School of Education	North Carolina State University Raleigh, North Carolina
James Hensel	Specialist in Agricultural Education	The Center for Research and Leadership Development in Vocational and Technical Education The Ohio State University Columbus, Ohio
Robert Kozelka	Chief of Business and Distributive Education	State Department of Education Springfield, Illinois
William B. Logan	Professor and Director Distributive Education Institutes, College of Education	The Ohio State University Columbus, Ohio
Sidney S. Sutherland	Professor Emeritus Department of Agricultural Education	University of California Davis, California
Ralph Wenrich	Head, Department of Vocational and Practical Arts Education, College of Education	University of Michigan Ann Arbor, Michigan

Vocational and Technical Education
in Agriculture
For Off-Farm Occupations

Harry G. Beard	Associate Professor of Education School of Education	North Carolina State University Raleigh, North Carolina
James W. Hensel	Specialist in Agricultural Education	The Center for Research and Leadership Development in Vocational and Technical Education The Ohio State University Columbus, Ohio
Robert Kozelka	Chief of Business and Distributive Education	State Department of Education Springfield, Illinois
William B. Logan	Professor and Director Distributive Education Institutes, College of Education	The Ohio State University Columbus, Ohio
Sidney S. Sutherland	Professor Emeritus Department of Agricultural Education	University of California Davis, California
Ralph Wenrich	Head, Department of Vocational and Practical Arts Education, College of Education	University of Michigan Ann Arbor, Michigan

Summary of Research Findings
in Off-Farm
Agricultural Occupations

William W. Stevenson	Director, Research Coordinating Unit for Vocational Education	Oklahoma State University Stillwater, Oklahoma
Homer V. Judge	Head, Agricultural Education Department	University of Massachusetts Amherst, Massachusetts
Don F. Seaman	Graduate Assistant in Agricultural Education	The Ohio State University Columbus, Ohio
Leonard Giambra	Graduate Assistant in Psychology	The Ohio State University Columbus, Ohio

Joseph W. Duncan	Chief, Manpower and Regional Economics Division	Battelle Memorial Institute Columbus, Ohio

Planning and Conducting
Cooperative Occupational Experience
in Off-Farm Agriculture

Donald Brock	Vocational Agriculture Teacher-Coordinator	Highland Park High School Topeka, Kansas
E. M. Chinnock	Vocational Coordinator	Cloquet High School Cloquet, Minnesota
Raymond Clark	Professor, Agricultural Education Department	Michigan State University East Lansing, Michigan
Mike Cullen	Director	Willmar Area Vocational Technical School Willmar, Minnesota
Stan Lancaster	Assistant State Supervisor Agricultural Education	Denver, Colorado
William B. Logan	Professor and Director Distributive Education Institutes, College of Education	The Ohio State University Columbus, Ohio
Gordon McMahon	Director, Division of Vocational-Technical Education	State Department of Education Oswego, New York
Bernard Nye	State Supervisor of Distributive Education	State Department of Education Columbus, Ohio
Clayton Riley	Vocational Agriculture Instructor	Reidland High School Paducah, Kentucky
Paul Shoemaker	Distributive Education Coordinator	Chillicothe High School Chillicothe, Ohio
Darrel Way	Livestock Specialist Agricultural Education	State Department of Education Little Rock, Arkansas

Agricultural Machinery
Service Occupations

Robert Alfred	Parts Distributor	Massey-Ferguson, Inc. Columbus, Ohio
R. C. Belt	Manager	R. C. Belt, Inc. Washington Court House, Ohio
George B. Blum, Jr.	Assistant Professor of Agricultural Engineering	North Carolina State University Raleigh, North Carolina
C. E. Boggs	District Service Manager	Allis Chalmers Manufacturing Company Columbus, Ohio
Joseph Bradley	Manager	Bradley Implement Company Algona, Iowa
C. E. Bundy	Teacher Educator in Agricultural Education	Iowa State University Ames, Iowa
R. W. Canada	Professor of Agricultural Education	Colorado State University Fort Collins, Colorado
Richard Carr	District Service Manager	John Deere Company Columbus, Ohio
L. A. Coomer	General Supervisor	Farm Equipment Service Chicago, Illinois
Ray Cunningham	Assistant District Service Manager	International Harvester Company Columbus, Ohio
Emory H. Dixon	Educational Consultant	Hobart Welding School Troy, Ohio
Raymond C. Dunlavy	Supervisor of Training	Hobart Welding School Troy, Ohio
Lewis Eggenberger	Teacher Educator Agricultural Education Department	Texas Technological College Lubbock, Texas
J. M. Fare	Agricultural Engineering Department	North Carolina State University Raleigh, North Carolina

Alfred Fozer	Field Engineer	The Lincoln Electric Co. Columbus, Ohio
Cliff Gerstenberger	Secretary-Treasurer	Iowa Retail Farm and Power Equipment Association, Inc. Des Moines, Iowa
L. L. Gibbons	Professor of Industrial Education	Colorado State University Ft. Collins, Colorado
Jerry Halterman	Instructor in Agricultural Engineering	Modesto Junior College Modesto, California
G. E. Henderson	Coordinator, Southern Association for Agricultural Engineering and Vocational Agriculture	University of Georgia Athens, Georgia
Thomas Hoerner	Instructor Agricultural Engineering Department	Iowa State University Ames, Iowa
Van H. Jarret	Associate Professor of Agricultural Education	Utah State University Logan, Utah
Arthur Johnson	Mechanics Instructor	Alexandria Area Vocational School Alexandria, Minnesota
Carlton Johnson	Associate Professor of Agricultural Engineering	The Ohio State University Columbus, Ohio
Robert E. Julian	Vocational Agriculture Instructor	Amphitheater High School Tucson, Arizona
W. M. Kirkpatrick	Associate Professor of Agricultural Engineering	California State Polytechnic College San Luis Obispo, California
Loren Larson	Parts Man Instructor	Alexandria Area Vocational School Alexandria, Minnesota
M. G. McCreight	Assistant Professor of Agricultural Education	University of Nebraska Lincoln, Nebraska
John Miller	District Service Manager	International Harvester Co. Columbus, Ohio
Harold M. Nestor	Instructor in Hydraulics	Columbus Area Technician School Columbus, Ohio

A. F. Otto	District Parts Manager	John Deere Company Columbus, Ohio
Harlan Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
George Schelin	Mechanics Instructor	Alexandria Area Vocational School Alexandria, Minnesota
Ralph G. Schweizer	President	Burlington Equipment Machinery Corp. Burlington, Iowa
Earl Scott	MDTA Instructor	Jefferson Area Schools Jefferson, Ohio
John Shuey	District Dealer Development Manager	International Harvester Co. Columbus, Ohio
T. J. Wakeman	Instructor Department of Agricultural Engineering	Virginia Polytechnic Institute Blacksburg, Virginia
Dan Walton	District Service Manager	Massey-Ferguson, Inc. Columbus, Ohio
Charles Whitney	Secretary	Farm Power and Equipment Dealers of Ohio Columbus, Ohio
Ivan Winland	Coordinator	Jefferson Area Schools Jefferson, Ohio
James W. Zepplin	Instructor	Wausau Technical Institute Wausau, Wisconsin

Agricultural Supply
Sales and Service Occupations

Hugh Aydelotte	Petroleum Manager	Franklin County Landmark Hilliards, Ohio
Roy O. Becker	Secretary-Manager	Ohio Seed Improvement Association Columbus, Ohio
V. A. Bergman	Manager, Salesman Training Division	Ralston Purina Company St. Louis, Missouri

Charles Besse	Director, Vocational Department	Southwestern High School Grove City, Ohio
Donald Brock	Vocational Agriculture Instructor	Park High School Minneapolis, Minnesota
Keith Brum	Field Manager	Geigy Agricultural Chemicals Yonkers, New York
Walter Callahan	Commercial Sales Manager	Landmark Cooperatives Columbus, Ohio
Daniel C. Chase	Head, Department of Agricultural Business Management	California State Polytechnic Institute San Luis Obispo, California
T. P. Christen	Farm Sales and Home Heating Sales	The Standard Oil Company Cleveland, Ohio
Harry L. Cook	Director of Research and Technical Service	Landmark Cooperatives Columbus, Ohio
Rex Cunningham	Vocational Agriculture Instructor	Arcadia High School Arcadia, Ohio
Garry L. Dean	Product Manager Pesticides Farm Supply Division	Landmark Cooperatives Columbus, Ohio
Jack Devitt	Vocational Agriculture Instructor	Ottoville High School Ottoville, Ohio
Alvin W. Donahoo	Secretary	Minneapolis Grain Exchange Minneapolis, Minnesota
James E. Dougan	Assistant State Supervisor Vocational Agriculture	State Department of Education Columbus, Ohio
H. B. Drake	Coordinator, Agri-business Technology	Springfield and Clark Co. Springfield, Ohio
Roger S. Dreyer	Executive Secretary	Ohio Petroleum Marketers Columbus, Ohio
H. E. Edwards	State Supervisor of Vocational Agriculture	State Department of Education Charleston, West Virginia
Dale T. Friday	General Manager, Farm Science Review and Extension Agronomist	The Ohio State University Columbus, Ohio

Clarence A. Gehrig	Executive Secretary	Ohio Council of Farmer Cooperatives, Inc. Columbus, Ohio
J. E. Girens	Assistant General Manager	Southern States Cooperative Richmond, Virginia
George Greenleaf	Executive Secretary	Ohio Grain and Feed Dealers Association Columbus, Ohio
C. Neilsen Griffith	Vice President, Membership and Public Relations	Landmark Cooperatives Columbus, Ohio
Paul Hartsook	Vocational Agriculture Instructor	Bowling Green High School Bowling Green, Ohio
Samuel G. Huber	Professor of Agricultural Engineering	The Ohio State University Columbus, Ohio
Ray M. Kesler	Vocational Agriculture Instructor	Morgantown High School Morgantown, West Virginia
Elton Kile	Elevator Manager	Plain City, Ohio
Ralph E. Kunze	Manager of Seed Services Seed and Fertilizer Division	Landmark Cooperatives Columbus, Ohio
Roy H. Lippert	Instructor, Agricultural Engineering	Modesto Junior College Modesto, California
George Luster	Associate Professor Agricultural Education	University of Kentucky Lexington, Kentucky
Howard P. Moore	Laboratory Supervisor Division of Plant Industry	Ohio Department of Agriculture Reynoldsburg, Ohio
Howard Nowels	Vocational Agriculture Instructor	Fremont High School Fremont, Ohio
Harry Plank	Vocational Agriculture Instructor	Green Local High School Smithville, Ohio
Paul F. Pulse	Director of Short Courses in Agriculture	The Ohio State University Columbus, Ohio
Thomas Pulse	High School Student	Hillsboro, Ohio
O. W. Randolph	Manager, Personnel and Public Relations	Moorman Manufacturing Co. Quincy, Illinois

Harlan Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
Clayton Riley	Vocational Agriculture Instructor	Reidland High School Paducah, Kentucky
William Ruth	Distributive Education Coordinator	Whitehall High School Whitehall, Ohio
Allan E. Settle	Director of Public Relations	Manufacturing Chemists' Association, Inc. Washington, D. C.
Paul Shoemaker	Distributive Education Coordinator	Chillicothe High School Chillicothe, Ohio
Ralph W. Tolbert	Sales Promotion Manager	Geigy Agricultural Chemicals Yonkers, New York
Charles C. Wanke	Manager	Case Feed and Produce Co. Janesville, Wisconsin
Richard E. Wells	Assistant Program Director, Feed Division	Landmark Cooperatives Columbus, Ohio
Jesse Yopp	Manager	Yopp's Seed Company Paducah, Kentucky

Horticulture
Service Occupations

Evan K. Alban	Professor of Vegetable Crops, Department of Horticulture and Forestry	The Ohio State University Columbus, Ohio
Rayalene Brizendine	Guidance Counselor	Pleasant View High School Grove City, Ohio
Ray Brush	Secretary	American Association of Nurserymen, Inc. Washington, D. C.
Donald Casey	Guidance Counselor	Pleasant View High School Grove City, Ohio

Richard D. Clugston	Vocational Agriculture Instructor	Bowie High School El Paso, Texas
C. C. Drawbaugh	Professor, Department of Agricultural Education	Rutgers University New Brunswick, New Jersey
Foster Franks	Supervisor, Parks and Forestry Division	Columbus, Ohio
Clyde Gordon	Superintendent	Spring Grove Cemetery Cincinnati, Ohio
Roy L. Hoffman	Manager	Hoffman Greenhouses Hilliard, Ohio
Robert P. Holdsworth, Jr.	Professor of Zoology and Entomology	The Ohio State University Columbus, Ohio
Allan Keil	Manager	Grove City Garden Center Grove City, Ohio
J. P. Mahlstede	Head, Department of Horticulture	Iowa State University Ames, Iowa
Kennard S. Nelson	Vice President	Jednak Floral Company Columbus, Ohio
Darrell Parks	Graduate Assistant Agricultural Education	The Ohio State University Columbus, Ohio
Robert E. Partyka	Associate Professor Botany and Plant Pathology	The Ohio State University Columbus, Ohio
Harold L. Porter	Chief, Plant Industry	Ohio Department of Agriculture Reynoldsburg, Ohio
E. C. Robert	Associate Professor, Turf Management Department of Horticulture	Iowa State University Ames, Iowa
Lloyd R. Roof	Landscape Superintendent	The Ohio State University Columbus, Ohio
Robert W. Schery	Director	Lawn Institute Marysville, Ohio
Harry K. Tayama	Assistant Professor Cooperative Extension Service	The Ohio State University Columbus, Ohio

E. C. Volz	Professor of Floriculture Department of Horticulture	Iowa State University Ames, Iowa
Ralph J. Woodin	Professor of Agricultural Education	The Ohio State University Columbus, Ohio

Agricultural Chemicals Technology

Dale DeRemer	Director, Special Agriculture Program	Northeastern Junior College Sterling, Colorado
James E. Christiansen	Assistant Professor Agriculture Education	University of Florida Gainesville, Florida

Occupational Guidance
For Off-Farm Agriculture

Linwood K. Bailey	Staff Assistant, Manpower Policy and Program Appraisal Division	United States Department of Agriculture Washington, D. C.
Earl Webb	Associate Professor Department of Agricultural Education	Texas A&M University College Station, Texas
Emanuel Weinstein	Occupational Analyst Program Services Branch	U. S. Office of Education Washington, D. C.

APPENDIX "B"

Participants in Advisory Meeting
of
January 14-15, 1965
on
Developing Programs of Education in Off-Farm Agricultural Occupations

Robert E. Taylor	Coordinator Director	The National Center for Advanced Study and Research in Agricultural Education The Ohio State University Columbus, Ohio
Herbert M. Hamlin	Co-Chairman, Visiting Professor of Education	North Carolina State University Raleigh, North Carolina
Glenn Z. Stevens	Co-Chairman, Professor of Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Harold Binkley	Teacher Educator, Agricultural Education	University of Kentucky Lexington, Kentucky
J. Kenneth Baker	Graduate Assistant Agricultural Education	The Ohio State University Columbus, Ohio
James E. Christiansen	Graduate Assistant Agricultural Education	The Ohio State University Columbus, Ohio
Raymond Clark	Teacher Educator Agricultural Education	Michigan State University East Lansing, Michigan
James Clouse	Teacher Educator Agricultural Education	Purdue University Lafayette, Indiana
John Coster	Teacher Educator Agricultural Education	University of Nebraska Lincoln, Nebraska
Rex Cunningham	Vocational Agriculture Teacher	Arcadia High School Arcadia, Ohio
Richard E. Geyer	Executive Secretary, Commission on Education in Agriculture and Natural Resources	National Academy of Sciences Washington, D. C.

Glenn Griffith	Vocational Agriculture Teacher	Westerville High School Westerville, Ohio
Ramsey Groves	Graduate Assistant Agricultural Education	The Ohio State University Columbus, Ohio
Norman Hoover	Teacher Educator Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Charles Langdon	Assistant Supervisor Vocational Agriculture	State Department of Public Instruction Lansing, Michigan
Ivan McGee	Graduate Assistant Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Lloyd Phipps	Teacher Educator Agricultural Education	University of Illinois Urbana, Illinois
Harry Plank	Vocational Agriculture Instructor	Green Local High School Smithville, Ohio
Harlan Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
James Wall	Executive Secretary	NVATA Lincoln, Nebraska
Ralph Woodin	Teacher Educator Agricultural Education	The Ohio State University Columbus, Ohio

APPENDIX "C"

Participants in Advisory Meeting
of
March 15, 1965
on
Developing Programs of Education in Off-Farm Agricultural Occupations

Robert E. Taylor	Coordinator Director	The National Center for Advanced Study and Research in Agricultural Education The Ohio State University Columbus, Ohio
Herbert M. Hamlin	Co-Chairman, Visiting Professor of Education	North Carolina State University Raleigh, North Carolina
Glenn Z. Stevens	Co-Chairman, Professor of Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Ralph E. Bender	Professor and Chairman Department of Agricultural Education	The Ohio State University Columbus, Ohio
Leon W. Bonner	Teacher Educator Agricultural Education	Alabama A&M College Normal, Alabama
William C. Boykin	Teacher Educator Agricultural Education	Alcorn A&M College Lorman, Mississippi
Theodore Caesar	Personnel Development Director	The Farm Bureau Cooperative Columbus, Ohio
Milton E. Collins	Assistant Supervisor, Guidance	Ohio State Department of Education Columbus, Ohio
Ramsey Groves	Graduate Assistant Agricultural Education	The Ohio State University Columbus, Ohio
H. Neville Hunsicker	Chief, Agriculture Occupations, Division of Vocational and Technical Education	U. S. Office of Education Washington, D. C.

Carlton E. Johnson	Associate Professor of Agricultural Engineering	The Ohio State University Columbus, Ohio
Homer V. Judge	Teacher Educator Agricultural Education	University of Massachusetts Amherst, Massachusetts
Alan A. Kahler	Teacher Educator Agricultural Education	Iowa State University Ames, Iowa
William Logan	Teacher Educator Distributive Education	The Ohio State University Columbus, Ohio
George L. Luster	Associate Professor Agricultural Education	University of Kentucky Lexington, Kentucky
Harlan E. Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
James D. Utzinger	Vocational Agriculture Teacher	Pleasant View High School Grove City, Ohio
Warren Weiler	State Supervisor, Vocational Agriculture	State Department of Education Columbus, Ohio
Charles N. Whitney	Executive Director	Farm and Power Equipment Retailers of Ohio Columbus, Ohio
Ralph Woodin	Teacher Educator Agricultural Education	The Ohio State University Columbus, Ohio

APPENDIX "D"

Participants in Advisory Meeting
of
April 5 and 6, 1965
on
Developing Programs of Education in Off-Farm Agricultural Occupations

Robert C. Anderson	Research Associate Department of Sociology	Michigan State University East Lansing, Michigan
John A. Beaumont	Occupations Branch, Division of Vocational and Technical Education	U. S. Office of Education Washington, D. C.
George Bell	Assistant Supervisor Business Education	State Department of Education Columbus, Ohio
R. C. Belt	Manager (Agricultural Mechanics Dealer)	R. C. Belt, Inc. Washington Court House, Ohio
Ralph E. Bender	Professor and Chairman Department of Agricultural Education	The Ohio State University Columbus, Ohio
John Bottum	Assistant Professor Department of Agricultural Economics	The Ohio State University Columbus, Ohio
Ray Brush	Secretary	American Association of Nurserymen, Inc. Washington, D. C.
C. E. Bundy	Professor, Department of Agricultural Education	Iowa State University Ames, Iowa
James Byrne	Chief, Farm Placement	Bureau of Unemployment Compensation Columbus, Ohio
Dolph Camp	Chief, Occupational and Career Guidance Section	U. S. Office of Education Washington, D. C.
M. J. Clark	Itinerant Teacher Trainer Agricultural Education	Southern University Baton Rouge, Louisiana

Milton Collins	District Supervisor for Southwestern Ohio Guidance Services Section	State Department of Education Columbus, Ohio
Edmund Cox	Agricultural Economist	Bureau of Unemployment Compensation Columbus, Ohio
William Davidson	Executive Assistant	Farm and Power Equipment Retailers of Ohio Columbus, Ohio
Marie Dirks	Professor, Home Economics	The Ohio State University Columbus, Ohio
H. B. Drake	Coordinator, Agri-Business Technology Program	Springfield and Clark Co. Springfield, Ohio
Homer Edwards	State Supervisor Vocational Agriculture	State Department of Education Charleston, West Virginia
Franklin Eldridge	Director of Resident Instruction, College of Agriculture and Home Economics	University of Nebraska Lincoln, Nebraska
T. L. Faulkner	State Supervisor Agricultural Education	State Department of Education Montgomery, Alabama
Norman H. Foote	Chairman, Division of Agriculture and Ornamental Horticulture	State University and Technical College Farmingdale, New York
George G. Greenleaf	Executive Vice President	Ohio Grain and Feed Dealers' Association Columbus, Ohio
Gilbert S. Guiler	Assistant Professor Department of Agricultural Education	The Ohio State University Columbus, Ohio
Jerry J. Halterman	Instructor, Agricultural Department	Modesto Junior College Modesto, California
Paul M. Hodgson	Assistant State Superintendent for Vocational and Technical Education	State Department of Public Instruction Dover, Delaware
Carlton Johnson	Associate Professor of Agricultural Engineering	The Ohio State University Columbus, Ohio

Donald R. Kaldor	Professor of Economics	Iowa State University Ames, Iowa
Allen Keil	President	Columbus Landscaping Association Columbus, Ohio
Max Kuster	Head, Agriculture Department	Joliet Junior College Joliet, Illinois
David McClay	Chairman, Department of Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Robert W. McCormick	Assistant Director, Cooperative Extension Service	The Ohio State University Columbus, Ohio
Murry McJunkin	Manager, Industry Relations	U. S. Steel Corporation Pittsburgh, Pennsylvania
E. M. Norris	Teacher Educator Agricultural Education	Prairie View A&M College Prairie View, Texas
L. J. Phipps	Chairman, Department of Agricultural Education	University of Illinois Urbana, Illinois
Paul F. Pulse	Director of Short Courses in Agriculture	The Ohio State University Columbus, Ohio
Harlan E. Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
Byrl R. Shoemaker	Director of Vocational Education	State Department of Education Columbus, Ohio
John T. Starling	Assistant Supervisor Vocational Agriculture	State Department of Education Columbus, Ohio
R.C.S. Sutliff	Chief, Bureau of Agricultural Education	State Department of Education Albany, New York
Warren G. Weiler	State Supervisor Vocational Agriculture	State Department of Education Columbus, Ohio
J. W. Warren	Assistant Supervisor Agricultural Education	State Department of Public Instruction Raleigh, North Carolina
Ralph J. Woodin	Professor, Department of Agricultural Education	The Ohio State University Columbus, Ohio

Appendix "E"

Participants
in
National Seminar on Off-Farm Agricultural Occupations
May 4 - 7, 1965

T. L. Faulkner	Supervisor Vocational Agriculture	Alabama
R. W. Montgomery	Teacher Educator Agricultural Education	Alabama
R. W. Cline	Teacher Educator Agricultural Education	Arizona
Carlos H. Moore	Supervisor Vocational Agriculture	Arizona
J. C. Atherton	Teacher Educator Agricultural Education	Arkansas
A. B. Rougeau	Teacher Educator Agricultural Education	Arkansas
Kenneth B. Cutler	Supervisor Vocational Agriculture	California
S. S. Sutherland	Teacher Educator Agricultural Education	California
Irving Cross	Teacher Educator Agricultural Education	Colorado
Paul J. Foster	Supervisor Vocational Agriculture	Colorado
Howard Martin	Teacher Educator Agricultural Education	Connecticut
Phil Masley	Teacher Vocational Agriculture	Connecticut
Ralph Barwick	Teacher Educator Agricultural Education	Delaware
William Dannenhauer	Teacher Vocational Agriculture	Delaware
W. T. Loften	Teacher Educator Agricultural Education	Florida

G. C. Norman	Supervisor Vocational Agriculture	Florida
J. G. Bryant	Supervisor Vocational Agriculture	Georgia
Tamotsu Horii	Supervisor Vocational Agriculture	Hawaii
Ralph Edwards	Supervisor Vocational Agriculture	Idaho
Ralph Guthrie	Supervisor Vocational Agriculture	Illinois
Lloyd Phipps	Teacher Educator Agricultural Education	Illinois
James Clouse	Teacher Educator Agricultural Education	Indiana
Harrison Gardner	Teacher Educator Agricultural Education	Indiana
Avery Gray	Supervisor Vocational Agriculture	Indiana
C. E. Bundy	Teacher Educator Agricultural Education	Iowa
C. W. Dalbey	Supervisor Vocational Agriculture	Iowa
Howard R. Bradley	Teacher Educator Agricultural Education	Kansas
C. C. Eustace	Supervisor Vocational Education	Kansas
Harold Binkley	Teacher Educator Agricultural Education	Kentucky
M. M. Botto	Supervisor Vocational Agriculture	Kentucky
Floyd Cox	Teacher Educator Agricultural Education	Kentucky
Roy Dillon	Teacher Educator Agricultural Education	Kentucky

George Luster	Teacher Educator Agricultural Education	Kentucky
W. C. Montgomery	Supervisor Vocational Agriculture	Kentucky
Charles Curtis	Teacher Educator Agricultural Education	Louisiana
James Hutchinson	Teacher Educator Agricultural Education	Louisiana
Whitney A. Langlois	Program Specialist Agricultural Education	Louisiana
C. P. McVea	Supervisor Vocational Agriculture	Louisiana
C. L. Mondart	Teacher Educator Agricultural Education	Louisiana
Wallace H. Elliott	Supervisor Vocational Agriculture	Maine
Ray Cardozier	Teacher Educator Agricultural Education	Maryland
Claud C. Marion	Teacher Educator Agricultural Education	Maryland
Homer Judge	Teacher Educator Agricultural Education	Massachusetts
Jesse Taft	Supervisor Vocational Agriculture	Massachusetts
Raymond M. Clark	Teacher Educator Agricultural Education	Michigan
Edwin St. John	Supervisor Vocational Agriculture	Michigan
Ernest Freier	Supervisor Vocational Agriculture	Minnesota
Milo Peterson	Teacher Educator Agricultural Education	Minnesota

E. E. Gross	Supervisor Vocational Agriculture	Mississippi
Obed L. Snowden	Teacher Educator Agricultural Education	Mississippi
W. T. Taylor, Jr.	Supervisor Vocational Agriculture	Mississippi
Earl T. Carpenter	Teacher Educator Agricultural Education	Missouri
Max L. Amberson	Supervisor Vocational Agriculture	Montana
Leo L. Knuti	Teacher Educator Agricultural Education	Montana
James T. Horner	Teacher Educator Agricultural Education	Nebraska
Glen H. Strain	Supervisor Vocational Agriculture	Nebraska
T. A. Butler	Teacher Educator Agricultural Education	Nevada
Howard Christensen	Teacher Educator Agricultural Education	Nevada
J. R. Peddicord	Supervisor Vocational Agriculture	Nevada
Neal Andrew	Supervisor Vocational Agriculture	New Hampshire
William Annis	Teacher Educator Agricultural Education	New Hampshire
Charles C. Drawbaugh	Teacher Educator Agricultural Education	New Jersey
George W. Lange	Supervisor Vocational Agriculture	New Jersey
L. C. Dalton	Supervisor Vocational Agriculture	New Mexico
J. D. McComas	Teacher Educator Agricultural Education	New Mexico
W. E. Drake	Teacher Educator Agricultural Education	New York

R. C. S. Sutliff	Supervisor Vocational Agriculture	New York
A. G. Bullard	Supervisor Vocational Agriculture	North Carolina
T. R. Miller	Teacher Educator Agricultural Education	North Carolina
Ernest L. DeAlton	Supervisor Vocational Agriculture	North Dakota
Winston H. Dolve	Teacher Educator Agricultural Education	North Dakota
Ralph E. Bender	Teacher Educator Agricultural Education	Ohio
Herbert D. Brum	Supervisor Vocational Agriculture	Ohio
Clarence Cunningham	Teacher Educator Agricultural Education	Ohio
James E. Dougan	Supervisor Vocational Agriculture	Ohio
Gilbert S. Guiler	Teacher Educator Agricultural Education	Ohio
Carlton Johnson	Teacher Educator Agricultural Education	Ohio
Floyd G. McCormick	Teacher Educator Agricultural Education	Ohio
Paul F. Pulse	Supervisor Agricultural Education	Ohio
D. R. Purkey	Supervisor Vocational Agriculture	Ohio
Harlan Ridenour	Supervisor Vocational Agriculture	Ohio
F. J. Ruble	Supervisor Vocational Agriculture	Ohio
Byrl Shoemaker	Supervisor Vocational Agriculture	Ohio
John T. Starling	Supervisor Vocational Agriculture	Ohio

Warren G. Weiler	Supervisor Vocational Agriculture	Ohio
Richard H. Wilson	Teacher Educator Agricultural Education	Ohio
Willard H. Wolf	Teacher Educator Agricultural Education	Ohio
Ralph J. Woodin	Teacher Educator Agricultural Education	Ohio
Byrle Killian	Supervisor Vocational Agriculture	Oklahoma
Robert R. Price	Teacher Educator Agricultural Education	Oklahoma
Leonard E. Kunzman	Supervisor Vocational Agriculture	Oregon
Henry A. TenPas	Teacher Educator Agricultural Education	Oregon
David R. McClay	Teacher Educator Agricultural Education	Pennsylvania
T. Dean Witmer	Supervisor Vocational Agriculture	Pennsylvania
Rafael Muller	Supervisor Vocational Agriculture	Puerto Rico
Raymond C. Northrup	Supervisor Vocational Agriculture	Rhode Island
David F. Shontz	Teacher Educator Agricultural Education	Rhode Island
Arthur K. Jensen	Teacher Educator Agricultural Education	South Carolina
Cecil H. Johnson, Jr.	Supervisor Vocational Agriculture	South Carolina
H. W. Gadda	Teacher Educator Agricultural Education	South Dakota
Louis A. Carpenter	Supervisor Vocational Agriculture	Tennessee
George W. Weigers	Teacher Educator Agricultural Education	Tennessee
Lewis Eggenberger	Teacher Educator Agricultural Education	Texas

John Holcomb	Teacher Educator Agricultural Education	Texas
George Hurt	Supervisor Vocational Agriculture	Texas
Vannoy Stewart	Teacher Educator Agricultural Education	Texas
Elvin Downs	Supervisor Vocational Agriculture	Utah
Stanley S. Richardson	Teacher Educator Agricultural Education	Utah
Cola D. Watson	Supervisor Vocational Agriculture	Vermont
M. A. Fields	Teacher Educator Agricultural Education	Virginia
L. M. Jewell	Supervisor Vocational Agriculture	Virginia
C. O. Loreen	Teacher Educator Agricultural Education	Washington
Joel Magisos	Supervisor Vocational Agriculture	Washington
O. J. Burger	Director Resident Instruction	West Virginia
R. C. Butler	Teacher Educator Agricultural Education	West Virginia
Guy Cain	Supervisor Vocational Agriculture	West Virginia
Lowell Cook	Teacher Educator Agricultural Education	West Virginia
Homer Edwards	Supervisor Vocational Agriculture	West Virginia
Glenn Fogle	Supervisor Vocational Agriculture	West Virginia
Byrl Law	Teacher Educator Agricultural Education	West Virginia
Claude McGhee	Teacher Educator Agricultural Education	West Virginia

Dale C. Aebischer	Supervisor Vocational Agriculture	Wisconsin
Walter Bjoraker	Teacher Educator Agricultural Education	Wisconsin
Marvin Thompson	Teacher Educator Agricultural Education	Wisconsin
Percy Kirk	Supervisor Vocational Agriculture	Wyoming
Jack Ruch	Teacher Educator Agricultural Education	Wyoming

A. J. Aiello	Farm Equipment Systems	Norick Brothers, Inc. Chicago, Illinois
Linwood K. Bailey	Staff Assistant	U. S. Dept. of Agriculture Washington, D. C.
Harry Beard	Acting Director of Vocational Education	North Carolina
Richard Bohning	Associate Dean College of Agriculture and Home Economics	The Ohio State University Columbus, Ohio
Kenneth F. Carnan	Supervisor Training Methods	Chicago, Illinois
R. L. Carr	Service Manager	John Deere Company Columbus, Ohio
L. A. Coomer	Supervisor of Service	International Harvester Co. Chicago, Illinois
Otis S. Cooper	Administrative Supervisor State Employment Service	Ohio
Harold Crawford	Teacher Vocational Agriculture	NVATA
Harold F. Duis	Assistant Director State Plans & Agreement State Vocational Service Bureau of Vocational & Technical Education	U. S. Office of Education Washington, D. C.
Jim Durkee	Teacher Vocational Agriculture	NVATA
Roger J. Fritz	Secretary & Director	John Deere Foundation Moline, Illinois
George G. Greenleaf	Executive Vice-President	Ohio Grain & Feed Dealers Columbus, Ohio
Russell L. Guin	Interstate Printers and Publishers	Illinois
Larry Heaton	Branch Manager John Deere Company	Columbus, Ohio
F. G. Hileman	Director of Service	John Deere Foundation Moline, Illinois
H. N. Hunsicker	Head, Agricultural Education Occupations	U. S. Office of Education Washington, D. C.

E. M. Hunt	Instructor, Program in Agricultural Business	Forsyth Technical Institute Winston-Salem, N. Carolina
Floyd Johnson	Vice-President	AVA Agricultural Division York, South Carolina
Donald V. Koenig	Division of Public and Association Relations	National Farm and Power Equipment Dealers Association
Whitney A. Langlois	Program Specialist	Department of Education Greenwell Springs, Louisiana
J. H. Lintner	Consultant	National Center Columbus, Ohio
Vernon Maack	Director Area Vocational School	Alexandria, Minnesota
R. O. Mattson	Branch Manager International Harvester Company	Columbus, Ohio
William Morris	Manager Dealer Development	International Harvester Co. Lombard, Illinois
Duane M. Nielsen	Director Educational Resources Development Branch Bureau of Research	U. S. Office of Education Washington, D. C.
Alvin Oliver		Alexandria, Virginia
Ed Rumps	Assistant Director State Plans and Grants	U. S. Office of Education Washington, D. C.
John Shuey	Manager Dealer Development	International Harvestor Co. Columbus, Ohio
Ernest Stedge	Instructor, Rockland County, Center of Technology and Education	West Nyack, New York
Ernest Tarone	Chairman, Agriculture Department, Modesto Junior College	Modesto, California
Grant Venn	Superintendent of Schools	Parkersburg, West Virginia
James Wall	Executive Secretary	NVATA
Emanuel Weinstein	Occupational Analyst	U. S. Office of Education Washington, D. C.

APPENDIX "F"

Participants of Area Meetings
on Off-Farm Agricultural Occupations

Participants
New York Area Meeting
May 17-19, 1965

Robert E. Bennett	Vocational Agriculture Instructor	Womogo Regional High School Litchfield, Connecticut
Kenneth C. Farmer	Vocational Agriculture Instructor	Southington High School Southington, Connecticut
Roger W. Lawrence	Vocational Agriculture Instructor	Woodrow Wilson High School Middletown, Connecticut
Hugh J. Ripper	Vocational Agriculture Instructor	Woodbury High School Woodbury, Connecticut
Philip G. Stiles	Food Distribution	University of Connecticut Storrs, Connecticut
L. L. Turner	State Supervisor Agricultural Education	State Department of Education Hartford, Connecticut
Clarke B. Wood	Vocational Agriculture	Housatonic Valley Regional High School Falls Village, Connecticut
Ralph P. Barwick	Head Teacher Educator Agricultural Education	University of Delaware Newark, Delaware
Tom McGarr	Instructor	Norfolk County Agricultural School Walpole, Massachusetts
H. P. Addison	Teacher Educator Agricultural Education	University of Maryland College Park, Maryland
Martin L. Mitchell	Acting State Director Vocational Agricultural Education	State Department of Education Concord, New Hampshire
C. C. Drawbaugh	Professor, Agricultural Education	Rutgers University New Brunswick, New Jersey

A. J. Juestrich	Vocational Agriculture Instructor	Hammonton High School Hammonton, New Jersey
Robert Kopf	Horticulture Instructor	Freehold Regional High School Freehold, New Jersey
George Lange	State Supervisor Agricultural Education	State Department of Education Trenton, New Jersey
Grant M. Miller	Research Assistant Agricultural Education	Rutgers University New Brunswick, New Jersey
Joe P. Bail	Head Teacher Educator Agricultural Education	Cornell University Ithaca, New York
J. M. Carter	Consultant Agricultural Education	Lyons Falls High School Lyons Falls, New York
George Chrein	Vocational Agriculture Instructor	John Bowne High School Queens, New York
Virgil Christensen	Assistant to the Director of Research	Cornell University Ithaca, New York
W. E. Drake	Teacher Educator Agricultural Education	Cornell University Ithaca, New York
Paul Emerling	Vocational Agriculture Instructor	Griffith Institute Springville, New York
Mr. Everette	New York Botanical Gardens	New York City, New York
Mrs. Hall	New York Botanical Gardens	New York City, New York
Richard Harrison	Vocational Agriculture Instructor	Southern Cayuga Central School King Ferry, New York
David Hartzog	United Nations	New York City, New York
Alan Lamb	Executive Secretary	New York Farm Equipment Dealers' Association Hamilton, New York
Everett C. Lattimer	Associate in Agricultural Education	State Department of Education Albany, New York
Harold L. Noakes	Associate in Agricultural Education	State Department of Education Albany, New York

W. E. Orsont	Bureau of Agricultural Education	State Department of Education Albany, New York
Steve Smith	Agricultural Consultant	State Department of Education Albany, New York
Ernest Stedge	Horticulture Instructor	Rockland County Center of Technical Education West Nyack, New York
R.C.S. Sutliff	State Supervisor Agricultural Education	State Department of Education Albany, New York
Carl Widger	Vice President of Region VI	NVATA Minnsville, New York
Frank Wolff	Associate in Agricultural Education	State Department of Education Albany, New York
W. J. Brown, Jr.	Vocational Education Instructor	Pennsylvania State University University Park, Pennsylvania
Samuel M. Curtis	Graduate Assistant Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Donald R. Dutrow	Vocational Agriculture Instructor	Western Area Joint High School Mifflinburg, Pennsylvania
William L. Hull	Graduate Assistant Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Gene M. Love	Associate Professor Agricultural Education	Pennsylvania State University University Park, Pennsylvania
David R. McClay	Professor and Head Department of Agricultural Education	Pennsylvania State University University Park, Pennsylvania
Ivan C. McGee	Graduate Assistant Agricultural Education	Pennsylvania State University University Park, Pennsylvania
William A. Robinson	Vocational Agriculture Instructor	Chambersburg Area Joint High School Chambersburg, Pennsylvania

Robert E. Steffy	Graduate Assistant Agricultural Education	Pennsylvania State University University Park, Pennsylvania
John Ball	Vocational Agriculture Instructor	Coventry High School Coventry, Rhode Island
John Emin, Jr.	Vocational Agriculture Instructor	Ponaganset High School North Scituate, Rhode Island
Ray C. Northrup	State Supervisor Agricultural Education	State Department of Education Providence, Rhode Island
C. S. McLearen	Associate Professor Agricultural Education	Virginia Polytechnic Institute Blacksburg, Virginia
R. H. Munsey	Vocational Education Instructor	Battle High School Abingdon, Virginia
T. J. Wakeman	Teacher Trainer in Farm Shops	Virginia Polytechnic Institute Blacksburg, Virginia
E. J. Johnson	Program Specialist Agricultural Education	U. S. Office of Education Washington, D. C.
Center Staff		
W. J. Becker	Consultant	The National Center for Advanced Study and Research in Agricultural Education The Ohio State University Columbus, Ohio
A. A. Kahler	Consultant	
J. D. Utzinger	Consultant	
G. Z. Stevens	Consultant	

Participants
Chicago Area Meeting
May 24-26, 1965

Fred Barne	Student	Joliet Junior College Joliet, Illinois
Don Coil	Executive Secretary	Illinois FFA Springfield, Illinois
Roger L. Courson	Vocational Agriculture Service	University of Illinois Urbana, Illinois
H. K. Engelking	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
Orval C. Floyd	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
Gerald R. Fuller	Assistant Professor	University of Illinois Urbana, Illinois
Ralph Guthrie	Chief, Agricultural Education	State Office of Education Springfield, Illinois
H. W. Homann	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
Kenneth E. James	Teacher Educator Agricultural Education	Illinois State University Normal, Illinois
Max H. Kuster	Head, Agricultural Department	Joliet Junior College Joliet, Illinois
John W. Matthews	Vocational Agriculture Service	University of Illinois Urbana, Illinois
Robert L. McFall	Farm and Industrial Equipment Association	Chicago, Illinois
Don Moeller	Public Relations Department	Swift and Company Chicago, Illinois
William Morris	Dealer Development Manager	International Harvester Co. Chicago, Illinois
Arthur C. Muns	Administrative Assistant to the President	Northern Illinois University De Kalb, Illinois

Lloyd J. Phipps	Professor, Agricultural Education	University of Illinois Urbana, Illinois
Al Redding	Assistant Director	State Department of Education Springfield, Illinois
George A. Richter	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
W. T. Schnathorst	Supervisor Educational Service	International Harvester Co. Chicago, Illinois
Elliott W. Silver	Farm Equipment Training Division Supervisor	International Harvester Co. Chicago, Illinois
H. M. Struhinger	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
Allan L. Utech	Supervisor Agricultural Education	State Board of Vocational Education Springfield, Illinois
J. R. Warmbrod	Assistant Professor of Agricultural Education	University of Illinois Urbana, Illinois
Charles L. Watson	Superintendent of Schools	Cessna Park Community Unit Cessna Park, Illinois
W. H. Witt	Teacher Educator Vocational Agriculture Service	University of Illinois Urbana, Illinois
Eugene S. Wood	Associate Professor School of Agriculture	Southern Illinois University Carbondale, Illinois
Ralph R. Bentley	Research Teacher Trainer Agricultural Education	Purdue University Lafayette, Indiana
James T. Black	Vocational Agriculture Instructor	Crothersville High School Crothersville, Indiana
Jon D. Cain	Graduate Assistant	Purdue University Lafayette, Indiana
James P. Clouse	Teacher Educator Agricultural Education	Purdue University Lafayette, Indiana
Harrison Gardner	Assistant Professor Agricultural Education	Purdue University Lafayette, Indiana

Avery Gray	State Supervisor	State Department of Public Instruction Indianapolis, Indiana
Donald Hayes	Superintendent of Schools	Decatur County Schools Greensburg, Indiana
Robert Hewlett	Vocational Agriculture Instructor	Woodburn High School Woodburn, Indiana
Jim McGuire	Teacher Educator Agricultural Education	Purdue University Lafayette, Indiana
Don Pennington	Vocational Agriculture Instructor	Crothersville High School Crothersville, Indiana
Bill Preston	Graduate Assistant	Purdue University Lafayette, Indiana
Bill Schmidlapp	Vocational Agriculture Teacher	Union-North School Lakeville, Indiana
Philip Teske	Teacher Trainer Agricultural Education	Purdue University Lafayette, Indiana
Gerald F. Barton	Assistant Supervisor in Agricultural Education	State Department of Public Instruction Des Moines, Iowa
Duane L. Blake	Assistant Professor Agricultural Education	Iowa State University Ames, Iowa
L. Glenn Brostrom	Superintendent of Schools	Waverly-Shell Rock Schools Waverly, Iowa
Allen A. Carrell	Vocational Agriculture Instructor	Shenandoah Community School Shenandoah, Iowa
Everett L. Clover	Community College	Muscatine, Iowa
C. W. Dalbey	State Supervisor Agricultural Education	State Department of Public Instruction Des Moines, Iowa
Elwood J. Mabon	Consultant in Agricultural Education	State Department of Public Instruction Des Moines, Iowa
Gary McVey	Vocational Agriculture Instructor	Chariton High School Chariton, Iowa
Larry L. Statler	Vocational Agriculture Instructor	Waverly-Shell Rock Schools Waverly, Iowa

Harold M. Byram	Head Teacher Educator Vocational Agriculture Education	Michigan State University East Lansing, Michigan
Edwin St. John	State Supervisor Vocational Agriculture	Michigan Department Public Instruction Lansing, Michigan
Guy E. Timmons	Teacher Trainer Vocational Agriculture Education	Michigan State University East Lansing, Michigan
Ken Austin	Executive Secretary	Retail Farm Equipment Association Owatonna, Minnesota
J. F. Malinski	Assistant Supervisor Agricultural Education	State Department of Education St. Paul, Minnesota
Gerald F. Page	Vice President	NVATA Nixa, Missouri
G. Ed Henderson	Research Associate	University of Nebraska Lincoln, Nebraska
M. G. McCreight	Teacher Trainer Agricultural Education	University of Nebraska Lincoln, Nebraska
Clarence W. Anderson	Vocational Agriculture Instructor	N.D. Vocational Agriculture Association Enderlin High School Enderlin, North Dakota
Kenneth Melin	Vocational Agriculture Instructor	Walsh County Agricultural School Park River, North Dakota
Richard N. Adams	Vocational Agriculture Instructor	Tecumseh High School New Carlisle, Ohio
H. B. Drake	Coordinator, Agricultural Business Technology	The Springfield and Clark County Technical Education Program
Vincent J. Feck	Coordinator, Vocational Horticulture	Cleveland Board of Education Cleveland, Ohio
Charles Hastings	Vocational Agriculture Instructor	Clyde High School Clyde, Ohio

James L. Pease	Vocational Agriculture Instructor	Maumee High School Maumee, Ohio
Harlan E. Ridenour	Director of the Ohio Vocational Agriculture Curriculum Materials Service	The Ohio State University Columbus, Ohio
John T. Starling	Assistant Supervisor Vocational Agriculture	State Department of Education Columbus, Ohio
A. J. Aiello	Farm Equipment Systems Division Manager	Norick Brothers, Inc. Oklahoma City, Oklahoma
Elmer J. Johnson	Program Specialist U. S. Office of Education	Department of Health, Education, and Welfare Washington, D. C.
Dale C. Aebischer	Chief, Agriculture Education	Board of Vocational and Adult Education Madison, Wisconsin
Doyle Beyl	Vocational Supervisor	State Board of Vocational and Adult Education Madison, Wisconsin
Arnold Cordes	State Supervisor	Board of Vocational and Adult Education Madison, Wisconsin
Ray Fletcher	Supervisor, Product Training	Allis-Chalmers Mfg. Co. Milwaukee, Wisconsin
James Hensel	Teacher Trainer Agricultural Education	University of Wisconsin Madison, Wisconsin
L. R. Hilterbrand	Teacher Educator Agricultural Education	Wisconsin State University River Falls, Wisconsin
M. L. Steinke	Executive Secretary	Wisconsin Impl. Dealers Association Madison, Wisconsin
Keith W. Stoehr	Instructional Supervisor	Kenosha Technical Institute Kenosha, Wisconsin
Raymond Wall	Instructor Agricultural Education	Wisconsin State University River Falls, Wisconsin

James Zepplin	Supervisor Agricultural Mechanics	Wausau Technical Institute Wausau, Wisconsin
Center Staff		
H. M. Hamlin	Consultant	The National Center for Advanced Study and Research in Agricultural Education The Ohio State University Columbus, Ohio
A. A. Kahler	Consultant	
W. J. Becker	Consultant	
J. D. Utzinger	Consultant	

Participants
Pullman Area Meeting
June 2-4, 1965

Tomotsu Horii	Program Specialist Agricultural Education	State Board of Education Honolulu, Hawaii
W. Borgen	Vocational Agriculture Instructor	Troy High School Troy, Idaho
Douglas Christensen	Vocational Agriculture Instructor	Kendrick High School Kendrick, Idaho
Lester Diehl	Superintendent of Schools	Genesee High School Genesee, Idaho
Kenneth Ertel	Teacher Educator Agricultural Education	Idaho University Moscow, Idaho
Kenneth Hansen	State Supervisor Agricultural Education	State Board of Vocational Education Boise, Idaho
Bob Haynes	Teacher Educator Agricultural Education	Idaho University Moscow, Idaho
Robert Hiemgartner	Vocational Agriculture Instructor	Genesee High School Genesee, Idaho
Dwight Kindschy	Teacher Educator Agricultural Education	Idaho University Moscow, Idaho
Kirk Rush	Agricultural Teacher	Moscow High School Moscow, Idaho
H. A. Winner	Teacher Educator Agricultural Education	Idaho University Moscow, Idaho
Larry Morrow	Vocational Agriculture Instructor	Bozeman, Montana
Richard Buckovic	Head, Agriculture Department	Mollala Unified High School Mollala, Oregon
Norman Burgess	Vocational Agriculture Instructor	Clackamas High School Milwaukie, Oregon

Norman Koopman	Vocational Director	La Grande High School La Grande, Oregon
Al Pfahl	Local Vocational Director	West Linn High School West Linn, Oregon
Joe Powell	Sales Manager	John Deere Company Portland, Oregon
David Raynalds	Head, Agricultural Education Department	Blue Mountain Community College Pendleton, Oregon
Owen Sabin	Superintendent of Schools	Milwaukie, Oregon
Darrell Ward	State Supervisor Agricultural Education	State Department of Education Salem, Oregon
Walden Wedin	Vocational Agriculture Instructor	McLoughlin Unified School Milton-Freewater, Oregon
Louis Anderson	Vocational Agriculture Instructor	Mead High School Mead, Washington
William Bakamos	Industrial Arts Education	Washington State University Pullman, Washington
Lee Barbee	Supervisor Agricultural Education	State Board for Vocational Education Olympia, Washington
Cecil A. Bradley	Coordinator of Instruction for Vocational Education	Seattle Public Schools Seattle, Washington
George Brain	Dean, College of Education	Washington State University Pullman, Washington
Archie Brislawn	Supervisor Distributive Education	Olympia, Washington
Bert L. Brown	State Director of Agricultural Education	State Board of Vocational Education Olympia, Washington
Orville Carnahan	Director of Vocational Technical Division	Yakima Valley College Yakima, Washington
Robert Corless	Supervisor	Sunnyside, Washington

Jerry Gleason	District Manager	Western Farmers Spokane, Washington
John Griffith	Agriculture Officer	Yakima Valley College Yakima, Washington
Vern Hagen	Vice Principal	Tumwater, Washington
Blaine Hardy	Vocational Agriculture Instructor	Wapato High School Wapato, Washington
Jesse Helm	Agriculture Teacher	Wenatchee Valley Junior College Wenatchee, Washington
Fred Huston	Agriculture Supervisor	Big Bend Community College Moses Lake, Washington
Eugene Irwin	Vocational Agriculture Instructor	Mossyrock High School Mossyrock, Washington
Walter Johnson	President	Spokane Community College Spokane, Washington
M. C. Knox	Supervisor Agricultural Education	State Board for Vocational Education Olympia, Washington
Gil Long	Agriculture Teacher	Deer Park, Washington
C. O. Loreen	Head Teacher Trainer Agricultural Education	Washington State University Pullman, Washington
Joel H. Magisos	Teacher Educator Agricultural Education	Washington State University Pullman, Washington
Dick Moe	MDTA	Olympia, Washington
Richard Nowadnick	Agricultural Education	Skajit Valley College Mount Vernon, Washington
Ralph Olmstead	Vocational Agriculture Instructor	Battle Ground High School Battle Ground, Washington
Kenneth Owen	Vocational Agriculture Instructor	Franklin Pierce High School Tacoma, Washington
Henry Polis	Supervisor Agricultural Education State Board of Vocational Education	Olympia, Washington

Walter Ritter	Director	Washington Nurserymens' Association Spokane, Washington
Robert Wallenstein	Dean of Applied Arts	Spokane Community College Spokane, Washington
Everett Webb	Teacher Educator, Retired, Agricultural Education	Washington State University Pullman, Washington
John Wilson	Agriculture Teacher	Yakima, Washington
Jay Wood	Vocational Agriculture Instructor	Medical Lake High School Medical Lake, Washington
Center Staff		
Glenn Z. Stevens	Consultant	The Center for Vocational and Technical Education The Ohio State University Columbus, Ohio
James Christiansen	Graduate Assistant	
William Becker	Consultant	

Participants
Denver Area Meeting
June 9-11, 1965

William F. Hendrix	Principal	Amphitheater High School Tucson, Arizona
Max Huff	Vocational Agriculture Instructor	Casa Grande Union High School Casa Grande, Arizona
Robert E. Julian	Vocational Agriculture Instructor	Amphitheater High School Tucson, Arizona
John R. Williams	Associate Professor of Agricultural Education	University of Arizona Tucson, Arizona
Phillip R. Zurbruck	Vocational Agriculture Instructor	Tempe, Arizona
Mel Adams	Vocational Agriculture Instructor	Greeley High School Greeley, Colorado
James Bohn	Vocational Agriculture Instructor	Rocky Ford High School Rocky Ford, Colorado
Delbert E. Borrelli	Principal	Cortez High School Cortez, Colorado
R. W. Canada	Head, Agricultural Education	Colorado State University Ft. Collins, Colorado
Irving C. Cross	Assistant Professor Agricultural Education	Colorado State University Ft. Collins, Colorado
Robert Datteri	Vocational Agriculture Instructor	Ft. Morgan High School Ft. Morgan, Colorado
Paul Foster	Supervisor Agricultural Education	State Board for Vocational Education Denver, Colorado
Patrick J. Gallavan	Director, Denver Mountain Parks	Denver, Colorado
Earl E. Julson	Associate Professor of Agricultural Education	Colorado State University Ft. Collins, Colorado
Stanley Lancaster	Teacher-Coordinator	Greeley Central High School Greeley, Colorado
M. G. Linson	Supervisor Agricultural Education	State Board for Vocational Education Denver, Colorado

R. E. Lucas	Principal	Ft. Morgan High School Ft. Morgan, Colorado
Charles Neal	Vocational Agriculture Instructor	Montezuma County High School Cortez, Colorado
Orville E. Pieper	Business Instructor	North Eastern Junior College Sterling, Colorado
F. W. Reich	Secretary	Mountain States Hardware and Implement Association Boulder, Colorado
Alton Scofield	Executive Secretary	Colorado Cooperative Council Englewood, Colorado
Robert E. Wall	Area Manager	U. S. Steel Corporation Greeley, Colorado
Raymond J. Agan	Head, Department of Agricultural Education	Kansas State University Manhattan, Kansas
Donald W. Brock	Vocational Agriculture Instructor	Righland Park High School Topeka, Kansas
Harold Shoaf	Executive Secretary	Kansas FFA Topeka, Kansas
James H. Walker	Assistant Director (Local level)	Topeka, Kansas
Mike Cullen	Area Vocational Agriculture Coordinator	Willmar Community College Willmar, Minnesota
John K. Coster	Professor of Agricultural Education	University of Nebraska Lincoln, Nebraska
B. E. Gingery	Consultant Agricultural Education	State Department of Education Lincoln, Nebraska
F. Farrell Higbee	General Manager	Triple S. Lab, Inc. Scottsbluff, Nebraska
Gerald J. Huntvork	Vocational Agriculture Instructor	University of Nebraska Curtis, Nebraska
Leon M. Janovy	Vocational Agriculture Teacher	Pierce High School Pierce, Nebraska
Stanley Matzki, Jr.	Director	School of Technical Agriculture Curtis, Nebraska

Roland Peterson	Agriculture Instructor	University of Nebraska Lincoln, Nebraska
Jack W. Sauder	Vocational Agriculture Instructor	Chase County High School Imperial, Nebraska
Elmer Schrag	Vocational Agriculture Instructor	North Platte High School North Platte, Nebraska
Severin B. Sorensen	Vocational Agriculture Instructor	Nebraska City High School Nebraska City, Nebraska
L. C. Dalton	State Supervisor Agricultural Education	State Board for Vocational Education University Park, New Mexico
Cleo A. Dupy	Graduate Assistant	Oklahoma State University Stillwater, Oklahmoa
Chris White	Assistant Teacher Trainer, Agricultural Education	Oklahoma State University Stillwater, Oklahoma
D. Kim Black	Vocational Agriculture Instructor	Jordan High School Sandy, Utah
Fred H. Cornaby	Vocational Agriculture Instructor	Central Utah Vocational School Provo, Utah
Dee Horton	Vocational Agriculture Instructor	Box Elder High School Brigham City, Utah
Von H. Jarrett	Teacher Educator Agricultural Education	Utah State University Logan, Utah
William E. McKell	Director, Vocational Education	Granit School District Salt Lake City, Utah
Floyd Petty	Vocational Agriculture Instructor	Weber County High School Ogden, Utah
E. J. Johnson	Program Specialist U. S. Office of Education	Department of Health, Education, and Welfare Washington, D. C.
John C. Bishop	Vocational Agriculture Instructor	Huntley High School Huntley, Wyoming
Jim Durkee	Teacher Educator, Farm Mechanics	University of Wyoming Laramie, Wyoming

Percy Kirk	State Director Agricultural Education	State Department of Education Cheyenne, Wyoming
Center Staff		
Glenn Z. Stevens	Consultant	The Center for Vocational and Technical Education The Ohio State University Columbus, Ohio
William Becker	Consultant	
Alan A. Kahler	Consultant	

Participants
Atlanta Area Meeting
June 21-23, 1965

R. A. Baker	Assistant Professor Agricultural Education	Auburn University Auburn, Alabama
W. E. Cooper	Assistant Teacher Trainer, Agricultural Education	Tuskegee Institute Tuskegee, Alabama
B. P. Dilworth	District Supervisor Agricultural Education	Auburn University Auburn, Alabama
T. L. Faulkner	State Supervisor Agricultural Education	State Department of Education Montgomery, Alabama
H. W. Green	District Supervisor Agricultural Education	Auburn University Auburn, Alabama
J. C. Hollis	District Supervisor Agricultural Education	State Department of Education Montgomery, Alabama
B. F. Rawls	FFA Executive Secretary and Forestry Specialist	Auburn University Auburn, Alabama
L. L. Sellers	District Supervisor Agricultural Education	Auburn University Auburn, Alabama
J. E. Smith	District Supervisor Agricultural Education	State Department of Education Montgomery, Alabama
B. J. York	District Supervisor Agricultural Education	State Department of Education Montgomery, Alabama
K. M. Eaddy	Assistant Teacher Educator	University of Florida Gainesville, Florida
Owen M. Lee, Jr.	Division Chairman Technical Education	Bartow, Florida
Floyd L. Northrop	Area Supervisor Agricultural Education	University of Florida Gainesville, Florida
Clarence J. Rogers	Assistant Professor Agricultural Education	University of Florida Gainesville, Florida
L. A. Sims	Teacher Educator Agricultural Education	University of Florida Gainesville, Florida

J. N. Baker	Assistant Supervisor Agricultural Education	State Department of Education Swainsboro, Georgia
J. L. Branch	Assistant Supervisor Agricultural Education	Abraham Baldwin Agricultural College Tifton, Georgia
T. D. Brown	Assistant Supervisor Agricultural Education	State Department of Education Atlanta, Georgia
J. G. Bryant	State Supervisor Agricultural Education	State Department of Education Atlanta, Georgia
Earl Burkhalter	Vocational Agriculture Instructor	Coffee County High School Douglas, Georgia
Virgil Carter	Vocational Agriculture Instructor	Appling County High School Baxley, Georgia
W. C. Causey	Teacher	Athens, Georgia
E. H. Cheek	Vocational Agriculture Instructor	Perry High School Perry, Georgia
M. T. Daws	Vocational Agriculture Instructor	Rockmart High School Rockmart, Georgia
A. O. Duncan	Associate Professor Agricultural Education	University of Georgia Athens, Georgia
Hailey Fleming	Vocational Agriculture Instructor	Commerce High School Commerce, Georgia
M. C. Gaar	Regional Representative	Department of Health, Education, and Welfare Atlanta, Georgia
Ellis Hite	Vocational Agriculture Instructor	Calhoun High School Calhoun, Georgia
Jimmy Hix	Vocational Agriculture Instructor	Jefferson High School Jefferson, Georgia
Roscoe C. Keaton	Vocational Agriculture Instructor	Vienna High School Vienna, Georgia
G. Y. McManus	Vocational Agriculture Instructor	Heard County High School Franklin, Georgia
J. H. Mitchell	Assistant Supervisor Agricultural Education	University of Georgia Athens, Georgia

J. S. Perry	Teacher	Rentz, Georgia
Harold Power	Farm Replacement Supervisor	Atlanta, Georgia
Joe F. Pruett	Secretary	Georgia Farm Equipment Association Macon, Georgia
Paul B. Salter	President	Georgia Equipment Association Jesup, Georgia
Sammy H. Sanders	Vocational Agriculture Instructor	Oconee County High School Watkinsville, Georgia
Oswell Smith	Vocational Agriculture Instructor	Patterson High School Patterson, Georgia
S. L. Stiles	Vocational Agriculture Instructor	Alfred E. Beach High School Savannah, Georgia
R. H. Tolbert	Head, Department of Agricultural Education	University of Georgia Athens, Georgia
J. T. Trammell	Vocational Agriculture Instructor	North Whitfield High School Dalton, Georgia
Elvin Walker	Vocational Agriculture Instructor	Norman Park High School Norman Park, Georgia
Robert L. Wilcox	Special Teacher	Douglas County High School Douglasville, Georgia
J. O. Williams	Teacher Trainer Agricultural Education	Fort Valley State College Fort Valley, Georgia
McKinley Wilson	Head, Itinerant Teacher Trainer, Agricultural Education	Fort Valley State College Fort Valley, Georgia
John M. Adams	District Supervisor Agricultural Education	State Department of Education London, Kentucky
Jim Bates	Vocational Agriculture Instructor	Warren County High School Bowling Green Kentucky
William R. Bingham	Teacher Educator Agricultural Education	University of Kentucky Lexington, Kentucky
Robert Kelley	State FFA Executive Secretary	State Department of Education Frankfort, Kentucky

George L. Luster	Associate Professor Agricultural Education	University of Kentucky Lexington, Kentucky
C. O. Neel	Supervisor Agricultural Education	State Department of Education Frankfort, Kentucky
J. Lynn See	Vocational Agriculture Instructor	Louisa High School Louisa, Kentucky
Ralph A. Speakes	Vocational Agriculture Instructor	Boyle County High School Danville, Kentucky
Murrell Webb	Vocational Agriculture Instructor	Christian County High School Hopkinsville, Kentucky
C. H. Chapman	Teacher Educator Agricultural Education	Southern University Baton Rouge, Louisiana
M. J. Clark	Teacher Trainer Agricultural Education	Southern University Baton Rouge, Louisiana
Tom S. Colvin	Area Supervisor Agricultural Education	State Department of Education Shreveport, Louisiana
Charles M. Curtis	Associate Professor Agricultural Education	Louisiana State University Baton Rouge, Louisiana
Jasper A. Hayles	Teacher	Lake Charles, Louisiana
J. R. Hodges	Area Supervisor Agricultural Education	Jena High School Jena, Louisiana
C. P. McVea	State Supervisor Agricultural Education	State Department of Education Baton Rouge, Louisiana
John H. Mitchell	Professor Agricultural Education	University of Southwestern Louisiana Lafayette, Louisiana
J. C. Simmons	Area Supervisor Agricultural Education	Baton Rouge, Louisiana
John Vallot	Executive Secretary FFA	State Department of Education Baton Rouge, Louisiana
W. C. Boykin	Head, Agricultural Education	Alcorn A & M College Lorman, Mississippi
Archie G. Gordon	Teacher Trainer Agricultural Education	Alcorn A & M College Lorman, Mississippi

E. E. Gross	State Supervisor Agricultural Education	State Department of Education Jackson, Mississippi
Walter L. Hutchins	Itinerant Teacher Trainer	State Department of Education Jackson, Mississippi
J. Roland Hamilton	Assistant Professor Agricultural Education	Mississippi State University State College, Mississippi
E. W. Holmes	Assistant Supervisor Agricultural Education	State Department of Education Oxford, Mississippi
P. V. Runnels	District Supervisor	Soso High School Soso, Mississippi
O. L. Snowden	Head, Agricultural Education Department	Mississippi State College State College, Mississippi
George M. Walker	Assistant Professor Agricultural Education	Mississippi State University State College, Mississippi
C. D. Bryant	Assistant Professor Agricultural Education	North Carolina State University Raleigh, North Carolina
C. G. Dawson	Consultant	Raleigh, North Carolina
V. B. Hairr	District Supervisor Agricultural Education	State Department of Public Instruction Raleigh, North Carolina
W. W. McClure	Curriculum Specialist for Agriculture	State Department of Public Instruction Raleigh, North Carolina
Carl D. Price	Division Chairman Agricultural Technology	Fayetteville, North Carolina
Cayce Scarborough	Head, Department of Agricultural Education	North Carolina State University Raleigh, North Carolina
Jeter P. Taylor, Jr.	Principal	Jones Central High School Trenton, North Carolina
L. J. Carter	District Supervisor Agricultural Education	State Department of Education Kingstree, South Carolina
C. G. Hutchinson	Vocational Agriculture Instructor	Conway High School Conway, South Carolina
M. P. Nolan	Teacher	Conway, South Carolina

J. P. Hall	District Supervisor Agricultural Education	State Department of Education Jackson, Tennessee
David Hamilton	Head Teacher Trainer Agricultural Education	Agricultural and Industrial State University Nashville, Tennessee
H. S. Moss	Supervisor	Nashville, Tennessee
R. A. Phillips	Vocational Agriculture Instructor	Central High School Savannah, Tennessee
J. Eldridge Price	Vocational Agriculture Instructor	Rogersville High School Rogersville, Tennessee
Nelson J. Senter	Teacher	Nashville, Tennessee
Albert Stone	Vocational Agriculture Instructor	Central High School Columbia, Tennessee
Boyd Trew	Teacher	Delano, Tennessee
Max Walker	Teacher	Huntingdon High School Huntingdon, Tennessee
E. M. Norris	Head, Teacher Trainer Agricultural Education	Prairie View A&M College Prairie View, Texas
J. R. Powell	Teacher Trainer Agricultural Education	Prairie View A&M College Prairie View, Texas
Charles A. Cox	Vocational Agriculture Coordinator	Dryden High School Dryden, Virginia
Lucy C. Crawford	Associate Professor Distributive Education	Virginia Polytechnic Institute Blacksburg, Virginia
D. D. Oliver	Vocational Agriculture Instructor	Abingdon High School Abingdon, Virginia
C. E. Tilson	Vocational Agriculture Instructor	Dublin High School Dublin, Virginia

ADVISORY COMMITTEE MEETING
for
DEVELOPING PROGRAMS OF EDUCATION IN OFF-FARM AGRICULTURAL OCCUPATIONS
at
THE NATIONAL CENTER FOR ADVANCED STUDY AND RESEARCH

IN AGRICULTURAL EDUCATION

April 5-6, 1965

Monday

9:00	Purpose and Expectencies of the Conference	Dr. Robert E. Taylor
	Progress Report: General Background	Dr. Robert E. Taylor
	Summarization of Research Studies	Dr. Glenn Z. Stevens
	Program Development Which is Proposed	Dr. Herbert M. Hamlin
	Proposed Instructional Materials	Dr. George L. Luster
	Introduction to Afternoon Session's Activities	
12:00	Lunch	Stouffer's Inn
1:30-2:45	Small Group Discussions	Auditorium, Room 205, Room 206
2:45	Coffee Break	
3:00-3:45	Reporting Panel of Small Group Discussion Leaders	Homer Edwards, Moderator
3:45-4:30	General Discussion and Reactions	
6:00-9:00	Dinner	Ohio Stater Inn, Room 248
	New Developments in Vocational Education	John Beaumont; United States Office of Education

Tuesday

9:00-10:20	Panel of Representatives from Business and Industry (Relationships to Vocational Education and Reactions to Task Force Proposals)	Agricultural Auditorium
10:20	Coffee Break	
10:35-12:00	Panel of Educators from Different Services (Reactions to Task Force Proposals and Relationships to Business and Industry)	Agricultural Auditorium
12:00-1:30	Lunch	
1:30	General Meeting Followed by Small Group Meetings Consisting of Conference Participants and Staff Members Working on Specific Problems in: a. Program Development b. Research Summarization c. Horticulture d. Agri-Merchandizing e. Agri-Chemicals f. Agri-Mechanics	Agricultural Auditorium and Rooms 205 and 206

APPENDIX "H"

CONFERENCE ON OFF-FARM AGRICULTURAL OCCUPATIONS

Agricultural Administration Auditorium
The Ohio State University

May 4 to 7, 1965

Monday, May 3

8:00 P. M. Early-Bird Registration and Coffee Hour
Ohio Stater Inn, 2060 North High Street

Tuesday, May 4

8:15 A. M. Bus Leaves Ohio Stater Inn for Auditorium

8:30 A. M. Registration

9:00 A. M. Introduction of Participants

9:15 A. M. Welcome to The Ohio State University----------Richard H. Bohning
Associate Dean
College of Agriculture and Home Economics
The Ohio State University

9:30 A. M. What Must and Can Be Done to Develop Programs for Off-farm Agricultural Occupations----------Harry Beard
Acting Director of Vocational Education
North Carolina

10:10 A. M. Coffee Break

10:25 A. M. Background and Development of Project Robert E. Taylor
Director
National Center for Agricultural Education

11:10 A. M. Summarization of Research Studies--Glenn Z. Stevens
Consultant
(Professor of Agricultural Education,
Pennsylvania State University)

Tuesday, May 4 (Continued)

11:45 A. M. Question and Answer Period on Summarization of Research Studies

12:00 Noon Lunch
Ohio Stater Inn

1:30 P. M. Rationale for the Development of Instructional Materials Prepared by Task Force ---------- George L. Luster
Consultant
(Associate Professor of Agricultural Education, University of Kentucky)

2:10 P. M. Presentation of Suggested Program Developmental Materials ---------- Herbert M. Hamlin
Consultant
(Visiting Professor in Education, North Carolina State University)

2:55 P. M. Coffee Break

3:10 P. M. Discussion and Questions

3:45 P. M. Symposium -- Reactions from Industry Representatives to Proposed Developments in Programs for Off-farm Agricultural Occupations --- William Morris
Dealer Development Manager
Farm Equipment Division
International Harvester Company

Alvin E. Oliver
Executive Vice President
Grain and Feed Dealers National Association

Jesse Yopp
Yopp's Seed Company
Paducah, Kentucky

Allen Keil
President
Columbus Landscaping Association

Moderator -- Ralph E. Bender
Chairman, Department of Agricultural Education
The Ohio State University

Tuesday, May 4 (Continued)

7:30 P. M. Proposed Changes in the FFA Organization ------ National FFA Study Committee
T. L. Faulkner, Chariman

Wednesday, May 5

8:15 A. M. The Agricultural Program of Modesto Junior College with Emphasis on a Program in Agricultural Chemical Technology ---------- Ernest Tarone
Chairman, Agriculture Department
Modesto Junior College

9:10 A. M. The Program in Agricultural Mechanics in the Area School at Alexandria, Minnesota ---------- Vernon Maack
Director
Area Vocational School
Alexandria, Minnesota

9:40 A. M. Ornamental Horticulture and Nursery Work for High School Students in Rockland County, New York ---------- Ernest Stedge
Landscaping Instructor
Rockland County Center of Technology and Education
West Nyack, New York

10:15 A. M. Coffee Break

10:30 A. M. Agricultural Business for Eleventh and Twelfth Grade Students at Reidland, Kentucky ---------- Harold R. Binkley
Associate Professor of Agricultural Education
University of Kentucky

11:00 A. M. Agricultural Business in the Forsyth Technical Institute, Winston-Salem, North Carolina ---------- E. M. Hunt
Instructor, Program in Agricultural Business
Forsyth Technical Institute

Wednesday, May 5 (Continued)

11:30 A. M. Lunch

1:00 P. M. Thumbnail Sketch of Curricular Materials Developed ---------- Task Force Personnel

Agriculture Supply Sales and Service Occupations ---------- William Becker

Agricultural Machinery Service Occupations ---------- Alan Kahler

Ornamental Horticulture Service Occupations ---------- James D. Utzinger

Occupational Experience Programs - Harold Anderson

2:00 P. M. Small Group Discussion of Materials Developed in Each Area (Specific materials for each area will be presented in these groups)

Program Development ---------- Herbert M. Hamlin
(Northwest Quarter of Auditorium)

Research Summarization --------- Glenn Z. Stevens
(Southwest Quarter of Auditorium)

Occupational Experience --------- Harold Anderson
(Room 205)

Horticulture ---------- James Utzinger
(Room 250)

Agricultural Mechanization ---------- Alan Kahler
(Room 252)

Agriculture Supply Sales and Services ---------- William Becker
(Northeast Quarter of Auditorium)

3:15 P. M. Coffee Break and Shift from First Group to Second Group

3:30 P. M. Repeat Session of Small Group Discussions (Each person would have attended two groups)

7:30 P. M. Informal Discussion of Program Areas
University High School
Rooms 204, 205, 302, 303

Thursday, May 6

Leadership Tasks for State Staffs in Implementing Programs in Off-Farm Agricultural Occupations

8:30 A. M. Administrative Responsibilities

Position Paper----------R. C. S. Sutliff
Chief, Bureau of Agricultural Education
New York

Discussant----------Harold T. Binkley
Professor of Agricultural Education
University of Kentucky

9:10 A. M. Changing Existing Programs

Position Paper----------T. L. Faulkner
State Supervisor, Agricultural Education
Alabama

Discussant----------Irving R. Cross
Assistant Professor of Agriculture
Colorado State University

9:40 A. M. Developing and Evaluating Pilot or Developmental Programs

Position Paper---------- Lloyd J. Phipps
Chairman of Agricultural Education
University of Illinois

Discussant---------- Max L. Amberson
State Supervisor, Agricultural Education
Montana

10:10 A. M. Coffee Break

10:30 A. M. Small Group Discussion Period Pertaining to the Three Position Papers Presented

12:00 Noon Lunch
Ohio Stater Inn

Thursday, May 6 (Continued)

1:30 P. M. Providing Qulaified Personnel

Position Paper ---------- David R. McClay
Head, Department of Agricultural Education
Pennsylvania State University

Discussant ----------V. Ray Cardozier
Chairman, Department of Agricultural Education
University of Maryland

2:00 P. M. Providing Occupational Experience

Position Paper ---------- C. E. Bundy
Head, Agricultural Education
Iowa State University

Discussant ---------- W. Howard Martin
Head, Department of Agricultural Education
University of Connecticut

2:30 P. M. Providing Vocational Education in Agriculture for Those Not Benefiting from the Regular Program

Position Paper ---------- Homer E. Edwards
State Supervisor, Vocational Agriculture
West Virginia

Discussant ---------- Rafael Muller
Director, Agricultural Education
Puerto Rico

3:00 P. M. Coffee Break

3:15 P. M. Small Group Discussion Period Pertaining to the Three Position Papers Presented

Thursday, May 6 (Continued)

6:00 P. M. Banquet
Franklin Room, Ohio Union

Toastmaster ---------- Warren G. Weiler
State Supervisor, Agricultural Education
Ohio

Emerging Concepts in Vocational
and Technical Education As Seen
by the U. S. Office of Education ------- Ed Rumpf
Assistant Director
State Plans and Grants
Division of Vocational and Technical Education
U. S. Office of Education

Friday, May 7

9:00 A. M. Program for Area Meetings in
Off-farm Agricultural Occupations

9:30 A. M. Planning Area Meetings
Sub-groups by Geographical Location

10:15 A. M. Coffee Break

10:30 A. M. Establishing Priorities Within States
for Programs in Off-farm Agricultural
Occupations ---------- Robert E. Taylor
Director
National Center for Agricultural Education

Duane M. Nielsen
Occupational Research and
Planning Program
Division of Vocational and Technical Education
U. S. Office of Education

11:45 A. M. Luncheon
Franklin Room, Ohio Union

Needs and Directions in
Vocational Education ---------- Grant Venn
Superintendent of Schools
Parkersburg, West Virginia
and Author
MAN, EDUCATION, AND WORK

Friday, May 7 (Continued)

2:00 P. M. Specific Policy Implications for Programs for Off-farm Agricultural Occupations ---------- Ed Rumpf
Assistant Director
State Plans and Grants
Division of Vocational and Technical Education
U. S. Office of Education

H. N. Hunsicker
Head, Agricultural Education Occupations Branch
Division of Vocational and Technical Education
U. S. Office of Education

2:30 P. M. Questioning Panel to Dr. Rumpf and Mr. Hunsicker

3:30 P. M. End of Conference

VT 000 080

VT 000 080 ED

Vocational Education and Changing Needs, A Proposed Comprehensive Area Vocational School to Meet Changing Needs in Kentucky. (Bulletin, vol. 38, no. 1).

*VOCATIONAL EDUCATION, *AREA VOCATIONAL SCHOOLS, *ADMINISTRATOR ATTITUDES, *EMPLOYER ATTITUDES, *TEACHER ATTITUDES, TRADE AND INDUSTRIAL EDUCATION, TEACHER EDUCATORS, AGRICULTURAL EDUCATION, STATE SUPERVISORS, INDUSTRIAL EDUCATION, ADVISORY COMMITTEES, OUT OF SCHOOL YOUTH, TEACHER SUPERVISION, OCCUPATIONAL GUIDANCE, PUBLIC RELATIONS, CURRICULUM, ADULT VOCATIONAL EDUCATION, GUIDELINES, EDUCATIONAL NEEDS, SCHOOL ADMINISTRATION, EVENING PROGRAMS,

Kentucky,

Survey forms were sent to 126 vocational school administrators, 10 state supervisors of trade and industrial education, 54 vocational agriculture teacher educators, 25 trade and industrial teacher educators from Kentucky and 11 southeastern states, and 64 Kentucky employers of graduates of Kentucky area vocational schools. The degree to which they accepted or rejected 60 statements on vocational education was studied to determine the basic principles of vocational education for meeting occupational needs. Statements covered administration, supervision, advisory services, vocational guidance and counseling, course offerings, in-school youth, out-of-school youth, part-time and evening training, public relations, away-from-school activities, and cooperating agencies. Based on the answers from the survey, 60 guidelines were projected for a comprehensive area vocational school. These included -- (1) Only a person who has had considerable experience in at least one of the vocational fields should be appointed head of a comprehensive area vocational school, (2) Continued teacher development is a necessary part of program development, (3) Advisory committees should be used for each of the vocational course offerings, and (4) In every community there are youths and adults out of school who need vocational guidance as much or perhaps more than those still in school. BUREAU OF SCHOOL SERVICE

COLLEGE OF EDUCATION • UNIVERSITY OF KENTUCKY

Editorial Staff for the Bulletin of the Bureau of School Service

Editor: W. Paul Street, Director, Bureau of School Service, University of Kentucky

Editorial Assistant: Jim Peyton, Graduate Assistant, College of Education, University of Kentucky

NEEDED: CONCENTRATION OVER A BROAD AREA

Increasingly the pressing demand is for more specialists *and* more generalists. This pressure creates an obvious but illusionary dilemma which has split American education for some time, and the prospects are for the split to continue. The alignment on either side of this split is sometimes confused by sub-issues, but it represents a gulf between "liberal" or "general" education on the one hand and "utilitarian" education on the other. It is a gulf across which many educators, and amateur thinkers about education, cannot see.

Actually, the "gulf" does not exist except in the imagination of those who, often enough, are the more sophisticated members of the profession. The naive can readily see that today demands a "jack of all trades" who must be "good at something." Common sense suggests that of course we must have persons of breadth who see life whole and steadily, and also persons who have knowledge, understanding and skill in depth in some area relevant to life today—and that if our society is to move toward democratic goals, these must be the same persons.

This understanding is beclouded often, however, by that little point: "in some area relevant to life today"—especially since *today* becomes *tomorrow* in twenty-four hours. Some ardent proponents of general education are quick to condemn specialty education because specialties get so quickly out of date these days—and the condemnation is *not*, it is worth noting, because specialties are not essential! Obviously, society now has few niches which could well be filled by the wheelwright, blacksmith, or harness maker. Consequently people in general education have too often taken a defeatist attitude: "Since we cannot be sure any particular specialty we teach today will be needed tomorrow, let us not teach any. Let us instead seek to produce resourceful, adaptable, resilient, self reliant persons who expect and welcome change—who do not have any special niche to fill in life."

The most partisan generalist is not likely, of course, to welcome major surgery under the knife of another mere generalist, even one who holds a Ph.D. in physiology or some broader phase of biology, who is without a *specialty* in surgery. Conversely, most of us would object to being opened by a "mechanic" who had simply memorized the operation and had no broad understanding of physiology; he might have to adapt himself to the peculiarities of our particular innards— and would need the resourcefulness which only a general education background might, we hope, give him. This is to say: The fact that specialties get outdated does not mean they are not needed! They just need to be kept in a broad context and up to date!

The big weakness in American vocational education, obviously, is the lack of a reliable, unimpeachable crystal ball. If we could foresee exactly what

Vocational Education and Changing Needs

A Proposed Comprehensive Area Vocational School To Meet Changing Needs In Kentucky

FOREWORD

Vocational education is an integral part of public education in the schools of Kentucky and the Nation. The national acts in vocational education provide for systematic instruction—class instruction and supervised work experience related to the class instruction. Practice is essential to learning. Participation in the vocation one would learn is necessary to his learning it. School people and the public at large are becoming increasingly aware of the significance of vocation education in preparing people for useful employment and that such programs must be adequately financed.

During the past forty-five years the states have devised various ways of providing vocational education. Some have limited their programs almost entirely to those associated with the high schools. Others have used area schools or community colleges to meet their needs. The Vocational Education Act of 1963 authorizes Federal grants to states to assist them to maintain, extend, and improve new programs of vocational education and to develop new programs of vocational education so that all persons of all ages in all communities of the state will have ready access to vocational training or retraining which is of high quality, which is realistic in the light of actual or anticipated opportunities for gainful employment, and which is suited to their needs, interests, and ability to benefit from such training.

The significance of this study by Dr. Leonard C. McDowell, a member of the faculty of the College of Education, University of Kentucky, becomes more important when one considers the broadened purposes of vocational education and the socio-economic changes in Kentucky and the Nation such as population movements, economic developments, educational developments, and technological developments.

Dr. McDowell, in this study, brings into focus socio-economic changes and accepted principles of vocational education which can be amalgamated so as to provide an organizational structure for comprehensive vocational schools capable of providing for the occupational needs of people in Kentucky. The findings of this study should make a singular contribution to the improvement of vocational education through the development of comprehensive vocational schools in the State and the Nation.

E. P. Hilton, Director
Vocational Education
Kentucky Department of Education

CHAPTER I

INTRODUCTION

Need for the Study

The purpose of vocational education is to prepare individuals to engage successfully in a socially useful occupation. This implies that the individual will be provided education for the development of skills, attitudes, and knowledge to the extent that he may enter or make progress in his chosen vocation. The way by which this may be accomplished varies from state to state, each state attempting to meet those vocational needs unique to its citizens. The concern for meeting these multiple needs is pointed up in "The Report to the President's Commission on National Goals," which states:

> The status of the individual must remain our primary concern. All our institutions—political, social, and economic—must further enhance the dignity of the citizen, promote the maximum development of his capabilities, stimulate their responsible exercise, and widen the range and effectiveness of opportunities for individual choice.[1]

In the above statement, change is inherently implied. As will be pointed out later in this study, Kentucky has made radical changes in the last half century, and particularly so in the last 25 years. Someone has said, "To stand still is but to retrogress." The question thus arises as to whether vocational education has, in reality, retrogressed by standing still, if it has stood still, or is advancing by meeting the changing occupational needs of the people. Vocational education has an essential service to perform under these changing conditions. "Improvements will have to be made and redirection will have to be given to present educational activities in order that vocational-technical education may do its part adequately . . . . Changing the scope and program of vocational education can provide educational opportunities through which many more citizens can achieve the economic security and social well-being consistent with the goals of the nation."[2]

There seems to be no value in "change for the sake of change." The question begins to pose itself—a change to what? Alteration in the *status quo* of practically any institution is difficult to bring about. It

threatens the pattern of life and work of many. Most persons resent change in patterns of behavior. Therefore, change, if change is necessary, will be more readily accepted if evidence can be produced which justifies the change.

No study has been made of patterns of operations for vocational education which would best meet the occupational training needs of out-of-school youth and adults of Kentucky. Present organization structures of the various vocational services (agricultural, education, distributive education, home economics education, and trade and industrial education) have emerged giving little or no consideration to the benefits that each may derive from the others in meeting the overall training needs of workers.

Thus, it seems apparent that a study should be made to determine the organizational structure which would permit the strengths of each branch of vocational education to be focused on meeting the vocational training needs of individuals.

A Philosophy of Vocational Education

All socially useful labor is honorable, and to each person it is of probable equal importance, although to the wider society the various occupations differ in monetary worth and in social value. If our society is to continue to advance, many types of labor are necessary. This situation seems to coincide with the different capabilities of people who perform these jobs. Fortunately, it is possible for each individual, with proper guidance, source of training, and motivation, to engage in an occupation which he will find satisfying and which will be a challenge to his capabilities, as well as one which will make a worthy contribution to society. To the extent that the individual, for whatever reason, is denied the privilege of occupying this position, to that extent society will be impoverished.

Vocational education connotes seriousness of purpose and assumes democracy. It makes provision for wide differences among individuals. It is an integral part of the total education of a person; however, its emphasis is pointed more directly at what an individual must know and be able to do in his chosen occupation. This fact does not keep the person from gaining satisfaction through creative expression or appreciation of beauty and design or engaging in ethical behavior, but enables him to feel a sense of pride and accomplishment and permits him to have a sense of well-being and worthwhileness.

An individual does not live apart from his occupation. His "job" probably occupies more hours in the total day than any other activity, and even though one may have left the physical location of the job, one's satisfaction or lack of it goes with him. Such considerations tend

to emphasize the need for greater efficiency in vocational education for all workers. Individually, it leads to personal worth; collectively, it leads to the economic strength and fulfillment of democratic ideas.

An individual's occupation approaches sacredness in that, principally, it is through this avenue that he reacts with his fellow man. If this reaction is to be positive, then it behooves society to make provisions for all—"of low and high degree"—to reach their greatest potential in meeting the training needs of their particular vocations.

Statement of the Problem

The various branches of vocational education have many contributions to make in meeting the occupation training needs of people. Some of these needs are minor and may be cared for in a short time; other requirements call for longer time and more detailed treatment. To date, the four branches of vocational education have been concerned almost wholly with meeting the needs of people which are peculiar to the interests of that particular branch. However, vocational requirements of workers today do not group themselves into single categories of needs. For example, the needs of many agriculture workers are of greater variety than those in the scope of farmer training, or the sales person's needs are broader than those of mere salesmanship.

It appears that if vocational education is to be of greater service in meeting the total training needs of workers, the services which make up this phase of education will be required to consider an "interdisciplinary" approach. As no device is now available to cope with this crossing of service lines for meeting the modern worker's occupational training needs, the problem poses itself in this manner: What organizational structure may be devised which will adequately meet the vocational training requirements of Kentucky out-of-school youth and adults and those in-school youth who may not now be effectively cared for under the present organizational structure?

Rationale

In arriving at the proposed organization an inductive chain of reasoning is followed: first, attention is directed to extensive socioeconomic developments that have occurred since the first vocational education act; second, the conclusion is drawn that these changing conditions, all pertinent to effective programs of vocational education, will make necessary a changing organization for meeting occupational training needs of people; third, there are certain principles, or truths, on which a sound program of vocational education may be built, and these principles are not unknown to persons experienced in vocational

education; and fourth, that sound principles and awareness of changing occupations may be so amalgamated that a local organization may be devised that will achieve a maximum effectiveness in meeting the occupational training needs of people.

Elements of change.—An extensive discussion on change seems to be unnecessary, and it is not the intent of the author to itemize all such changes, even if it were possible. However, it is felt that some of the socio-economic developments that have occurred that affect vocational education are so pertinent that their oversight may tend to give a distorted view of the need for a changing vocational education organization at the local level.

The first of these developments pertains to *population movements.* People move, mostly, for economic reasons. Whether this movement is interstate or intrastate, the factor is of prime importance to vocational educators. Individuals move to "jobs" and from "jobs."

Kentucky is becoming more urban and less rural; counties with urban centers gain more people than counties without urban centers. U.S. Census data reveal that there has been an abnormal trend of outmigration during the last three decades, resulting in a much smaller population growth for the state than that of the national average.[1] Movement of population indicates changing needs and it is imperative that programs of vocational education change to meet these needs.

The second of these changes which demands attention, if vocational education is to accomplish its objectives, concerns *economic developments in agriculture, mining, manufacturing, and the service occupations.* Kentucky has altered its employment pattern from one of an agrarian nature to one of an industrial. The trend is away from farming. During the 1950's the number of people employed in manufacturing increased by 46,000; in farming, during this same decade, there was a decrease of approximately 113,000.[2]

Coal mining, an industry on which eastern Kentucky has long depended for employment and general economic stability, is a sick industry—sick not in the sense of production but from the aspect of employment. In 1950, the employment of miners stood at 75,956. In 1963 this employment dropped to less than 29,000. The severity of this loss of wage income and the resulting economic consequence becomes more meaningful when it is known that employment in mining during the deepest depression years of the 1930's never was less than 40,000.

---

[1] During the decade 1950-60, the population gain in Kentucky was 3.2 percent while the national population gain was 18.5 percent.

[2] U.S. Bureau of the Census, *United States Census of Population: 1960,* General Social and Economic Characteristics, Kentucky, p. 164.

This unemployment in mining has created a surplus of labor which, in turn, has caused an exodus of population from the Appalachian Area of Kentucky. (During the decade 1950-60, 19 counties in eastern Kentucky suffered population losses of over 5,000. Six of these counties had losses of over 15,000.)

When the Smith-Hughes Law (1917) was enacted, the service occupations were of such little consequence that no provision was made to train people so employed or those to be employed. Employment in these occupations has grown to such extent that in 1960 approximately one out of three workers is employed in wholesale and retail trade; finance, insurance and real estate; personal services; and public administration.

If the training needs of people resulting from changing occupational patterns are to be cared for, then it would seem logical that training agencies should alter their training programs to meet these needs.

A third change that seems to be salient is that of *educational development*—teacher qualifications, facilities, methods, and media for teaching—all resulting in quality education. Various Federal acts have also added a national flavor to education, an aspect that did not exist in 1917. These facts, and others, have changed the expectations of people where education is concerned; a higher level of thinking has resulted; a more critical eye for all education has come about. If vocational education is to thrive (or survive), it must reflect efficiency or others will assume its role.

A fourth aspect of change which greatly concerns vocational education, and which relates to the three changes mentioned above, is that of *technology*. Some of the developments which seem to have greatest impact are radio and television, advanced mechanization and automation, and methods of transportation. Surely it would be impossible to determine the extent of importance of these developments. Suffice it to say that it is tremendous. As a result of the various technologies, jobs both vanish and appear. Sociological problems as well as employment problems are apparent. (The full effects of developments in space exploration and atomic energy have not really been felt by Kentucky citizens.)

Generally, it may be said that the citizen of 1917 is not the citizen of today. His concepts have broadened; he has a greater appreciation for scientific knowledge; he is less satisfied with the mediocre; he thinks less on the local level and more on the national and international levels. He knows more, wants more, and deserves more because of technological development.

Statistical Treatment of the Data

The data were collected and recorded for both subgroup and total group responses. Privilege was given to the respondents to reply to each of 60 statements in one of five possible ways: strongly agree, agree, no opinion, disagree, and strongly disagree. In the determination of acceptance of the statements by the subgroups and the total group, the statistical measure, chi-square, was used. Because "strongly agree" and "agree" are relative (as are "disagree" and "strongly "disagree"), only the positive ("strongly agree" and "agree") and negative ("disagree" and "strongly disagree") were considered in the calculations. Chi-square was figured by using the formula $X^2 = \Sigma \left[\frac{(fo\text{-}fe)^2}{fe} \right]$. Correction for continuity was made by deducting .5 from the difference between the expected frequencies and the observed frequencies[1]

Because the researcher was interested in only the extent of agreement of the respondents, and the chi-square test is one which cares for both ends of the probability curve (a "two-tailed" test), it was necessary to use $P/_2$ to obtain the probability for agreement.

Acceptance was considered significant when agreement was calculated at the .05 level or less.

CHAPTER II

BASIC PRINCIPLES OF VOCATIONAL EDUCATION FOR MEETING OCCUPATIONAL NEEDS

If an organizational structure is to be proposed that will adequately meet the occupational needs of Kentucky citizens, it must be based on a sound foundation. It is the purpose of this chapter to list those principles which may serve as this foundation. This is to be accomplished by determining the extent of acceptance of a list of sixty statements by a panel of experts consisting of 126 vocational school administrators, 10 state supervisors of trade and industrial education, 56 teacher educators of vocational agriculture, 25 teacher educators of trade and industrial education, and 64 Kentucky employers of graduates of Kentucky area vocational schools. In addition to those from Kentucky, the panel is composed of persons from 11 southeastern states: Tennessee, Georgia, Virginia, West Virginia, North Carolina, South Carolina, Florida, Mississippi, Arkansas, Louisiana, and Alabama. It is believed the socio-economic conditions within these states are more nearly like those of Kentucky than those in the states in the North or West, and therefore opinions of respondents from the southeastern states may be more applicable in solving problems in vocational education in Kentucky.

The survey instruments were sent to all of the persons employed in the various vocational education groups in all the twelve southeastern states (including Kentucky). The number of forms sent and the number and percentage returned by group are indicated in Table 1.

In an effort to obtain opinions from a more heterogeneous group, the writer arranged to have the 60 statements of principles evaluated by 64 employers of graduates from the area vocational schools in Kentucky. Even though the association of these employers with vocational education has been only through graduates of present institutions (which may be the best kind of association for evaluation purposes), it was believed their judgements would be of value in determining sound principles on which to base future vocational education efforts.

The Survey Form

The sixty statements of principles were gleaned from various volumes pertaining to principles and philosophy of vocational education, addresses by various persons associated with vocational education,

TABLE 1

Industrial Employers . .	120	64	53.3
TOTAL	407	281	69.0

and from extensive conversations and experiences the writer has had in working with others engaged in vocational education. The statements are divided into 11 categories: administration, supervision, advisory services, vocational guidance and counseling, course offerings, in-school youth, out-of-school youth, part-time and evening training, public relations, away-from-school activities, and cooperating agencies. It is possible that the statements could have been categorized in other ways. The number of principles which might be used to help substantiate a proposed structure are endless. Those used in the survey seemed to the writer to be more pertinent than others. In reality, each principle, or statement, is an hypothesis which is being either accepted or rejected by the panel.

Five choices were provided for checking each statement of principle: (1) strongly agree, (2) agree, (3) I have no opinion, (4) disagree, and (5) strongly disagree. Statements not checked by the respondents were tallied as "I have no opinion." While "strongly agree" and "agree" may be relative, they should offer some insight into the extent of positiveness of the respondents. Likewise, "disagree" and "strongly disagree" should offer some knowledge about the extent of negativeness.

A question may arise in the mind of the reader concerning the relative value of responses by each of the various groups of respondents. Will responses from vocational school administrators, persons directly engaged in administrating a "grass roots" program of vocational education, have more value than those from agriculture teacher educators or industrial employers who have never had such experience? Because of this concern, the responses made by each of the

groups, as well as the entire group, are listed. After considering the opinions of the groups, both separately and collectively, the writer concludes with a statement as to degree of acceptance or rejection for each of the 60 statements.

Acceptance or Rejection of the 60 Statements

1. *The administrative head of an area-type school should be responsible to a higher administrative group.*

Probably all school personnel, finally, trace their responsibility to higher administrative groups: either local boards of education, state boards of education, boards of regents, or some like group. However, the subject statement is concerned with direct responsibility. The respondents accepted this statement in the manner shown in Table 2.

It will be noted that agreement with the statement is rather definite as 129 respondents *strongly* agreed whereas 124 only agreed.

Summing the responses of "strongly agree" and "agree" and of "disagree" and "strongly disagree" reveals that positive agreements total 253, whereas negative agreements total 18. Statistically, the level of significance for agreement with the statement is less than .01, and therefore it may be accepted as a definite principle on which to build a sound vocational education structure.

2. *The administrative head may delegate authority to his assistants commensurate with the responsibility he gives them.*

This statement is considered by many in business administration as a basic principle of organization—the principle of "authority and

TABLE 2

Degree of Acceptance of Statement 1 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	129	124	10	9	9
Agriculture teacher educators	56	38	15	1	2	0
State supervisors of industrial education	10	4	4	1	0	1
Trade and industrial teacher educators .	25	11	13	0	1	0
Vocational school administrators. . .	126	57	55	2	4	8
Employers of Kentucky area vocational school graduates. .	64	19	37	6	2	0

responsibility"—and a principle necessary to the success of all scalar organizations. Table 3 shows that all but two respondents agreed with the statement; the two who did not agree had no opinion.

The significant fact revealed in this table is the definiteness with which the group accepted the principle. Because industrial management has generally accepted the principle of "authority and responsibility," it would seem that responses by this subgroup would have

TABLE 3

Degree of Acceptance of Statement 2 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	154	125	2	0	0
Agriculture teacher educators	56	37	19	0	0	0
State supervisors of industrial education	10	3	7	0	0	0
Trade and industrial teacher educators .	25	14	11	0	0	0
Vocational school administrators. . .	126	69	56	1	0	0
Employers of Kentucky area vocational school graduates. .	64	31	32	1	0	0

been more positive in their agreement. However, the positiveness of the total group in agreeing with the statement would cause it to be considered as a basic principle for an organization providing vocational education.

3. *The administration of the school should be kept close to the people.*

This statement has been made, and heard, by many educators. To some extent it is stated in the vernacular, but it was believed that its meaning would be sufficiently clear in expressing the idea that school administrators should not set themselves aside or hold themselves aloof from the public who support the institution which is actually designed to serve them. Table 4 shows how the total group and subgroups reacted to the statement.

Even though the results of the survey show that the statement can be considered as a general truth, it may appear odd to the reader that as many as 25 respondents have no opinion as to its acceptance. It will be noted that 10 of these responses were made by the employers who may not have understood the meaning of the statement.

TABLE 4

Degree of Acceptance of Statement 3 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	120	121	25	13	2
Agriculture teacher educators	56	31	22	1	1	1
State supervisors of industrial education	10	2	5	3	0	0
Trade and industrial teacher educators .	25	12	10	2	1	0
Vocational school administrators . .	126	58	53	9	6	0
Employers of Kentucky area vocational school graduates. .	64	17	31	10	5	1

A total of 242 answered positively in accepting the statement, while 15 disagreed. The high level of agreement with the principle would indicate its acceptance in projecting a structure for meeting people's needs in vocational education.

4. *The administration of vocational education will be efficient in proportion as it is elastic and fluid rather than rigid and standardized.*

The purpose of vocational education is to meet the training needs of people. As these needs change, it would appear that provisions for meeting them would likewise change. Table 5 shows the extent of agreement the respondents had with the statement.

Overwhelming acceptance of this statement by each subgroup shows that administrative procedures must be susceptible to change if they are to meet vocational education needs. Only the employers indicated a lesser number of "strongly agree" than "agree." This fact, in addition to the seven who had no opinion and the three who disagree, would indicate a greater reservation in acceptance. However, the almost complete acceptance of the statement is significant to such an extent that it should be considered a basic principle in the administration of vocational education.

5. *Only a person who has had considerable experience in at least one of the vocational fields should be appointed head of a comprehensive area vocational school.*

This statement might imply that individuals who are good administrators, in general, and who have no vocational education background,

TABLE 5

Degree of Acceptance of Statement 4 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	153	110	11	6	1
Agriculture teacher educators	56	33	20	0	3	0
State supervisors of industrial education	10	7	2	1	0	0
Trade and industrial teacher educators .	25	14	11	0	0	0
Vocational school administrators. . .	126	78	44	3	0	1
Employers of Kentucky area vocational school graduates. .	64	21	33	7	3	0

would not be successful heads of vocational schools. This thinking is borne out in the present requirements for directors of area vocational schools in Kentucky.[1]

Probably the most significant aspect about the respondents' agreement is the extent of positiveness of their acceptance. Of the 238 who accepted the statement, more than 64 percent *strongly* agreed. The employers were the most conservative subgroup which accepted the statement. However, when the responses are considered on a basis of positive agreement versus negative agreement, even the employers accepted the principle at a level of significance of less than .01. Table 6 shows the extent to which the 281 respondents agreed with this statement.

It may be stated with a high degree of certainty that the statement may properly be accepted as a guiding principle in selecting head administrators for comprehensive area vocational schools.

6. *At least one member of the State Department of Education representing vocational education should be included in any area group which may have administrative functions in an area vocational school program.*

The central idea in this statement is that of providing a liaison between a local administrative group and the State Department of

[1] Directors of Kentucky area vocational schools must have completed 16 semester hours in approved vocational education courses, and have had at least three years experience in teaching or coordinating approved trade and industrial education classes.

TABLE 6

Degree of Acceptance of Statement 5 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	153	85	13	27	3
Agriculture teacher educators	56	32	19	2	2	1
State supervisors of industrial education	10	6	2	1	1	0
Trade and industrial teacher educators .	25	13	10	0	2	0
Vocational school administrators. . .	126	78	32	4	11	1
Employers of Kentucky area vocational school graduates. .	64	24	22	6	11	1

Education from which financial aid and consulative services are provided. Probably the aspects of most interest in Table 7 are the differences of opinion of the state supervisors of trade and industrial education and the vocational school administrators and trade and industrial teacher educators. As shown in Table 7, this statement was less warmly received than were the preceding statements.

All the state supervisors, except two who had no opinion, desired connecting links with local administrative groups, while the local voca-

TABLE 7

Degree of Acceptance of Statement 6 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	79	125	35	29	13
Agriculture teacher educators	56	21	24	6	5	0
State supervisors of industrial education	10	4	4	2	0	0
Trade and industrial teacher educators .	25	6	10	2	5	2
Vocational school administrators. . .	126	31	52	16	16	11
Employers of Kentucky area vocational school graduates. .	64	17	35	9	3	0

tional school administrators were much less opinionated. Almost 25 percent of the administrators who had an opinion did not accept the statement. Agreement by industrial teacher educators, significant at the .05 level, indicates acceptance by this subgroup. The dissentions were not sufficient to prevent over-all acceptance of the statement, the results being significant at less than the .01 level. The statement is therefore an accepted principle.

7. *The genuine concern of people for vocational education will be in proportion to their understanding of its objectives and services.*

This statement, if accepted, would have great implications for an administrator regarding how he might emphasize his public relations program—how he would budget his "working day." Table 8 shows the acceptance of this statement.

TABLE 8

Degree of Acceptance of Statement 7 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	186	90	4	1	0
Agriculture teacher educators	56	34	20	2	0	0
State supervisors of industrial education	10	7	3	0	0	0
Trade and industrial teacher educators .	25	21	4	0	0	0
Vocational school administrators. . .	126	91	34	0	1	0
Employers of Kentucky area vocational school graduates. .	64	33	29	2	0	0

With the exception of one vocational school administrator who disagreed and four other respondents who had no opinion, the total group accepted the statement—186 respondents *strongly* agreeing. The statement should therefore be considered a basic principle for guiding the vocational school administrator.

8. *The head administrator of a vocational school should be totally responsible for all activities in the institution.*

The statement is akin to the basic organizational principle—"One cannot delegate away his responsibility." Even though delegation of responsibility and authority is inherent in the administrative activity,

the feeling exists among some administrators that once responsibility is delegated to another they have no further responsibility for the particular task. Table 9 shows how the total group and subgroups accepted the statement.

TABLE 9

Degree of Acceptance of Statement 8 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	138	105	2	31	5

Trade and industrial teacher educators .	25	15	10	0	0	0
Vocational school administrators. . .	126	68	44	0	12	2
Employers of Kentucky area vocational school graduates. .	64	22	33	1	7	1

Of the total group who had definite opinions about the statement, 243 accepted it and 36 did not accept it. Perhaps many of those who disagreed did so because of the word, "totally," which was used to describe the head administrator's extent of responsibility. Some of the respondents who disagreed either circled or underscored the word. It seems significant that the state supervisors, themselves administrators, agreed 100 percent with the statement—9 of the 10 *strongly* agreeing. The highest percentage of rejections of the statement came from the agriculture teacher educators. Of this subgroup who had opinions, more than 25 percent declined to accept it. This fact contrasts with the teacher educators of trade and industrial education who gave 100 percent acceptance of the principle, 60 percent *strongly* agreeing.

This principle should be considered as a guiding principle for vocational school administrators.

9. *Vocational education should be provided wherever there is a need to train youth and adults for jobs that exist.*

This statement would imply that vocational education should be widespread because youth and adults are widespread and, jobs existing, their needs would become automatic. Meeting these needs would also imply that particular attention should be given to part-time evening

extension classes. The respondents were positive in their acceptance of the statement, as shown in Table 10.

This was the only one of the 60 statements under study about which all respondents had opinions—either positive or negative. The

TABLE 10

Degree of Acceptance of Statement 9 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	172	98	0	9	2

State supervisors of industrial education	10	6	4	0	0	0
Trade and industrial teacher educators .	25	18	7	0	0	0
Vocational school administrators. . .	126	87	33	0	4	2
Employers of Kentucky area vocational school graduates. .	64	34	29	0	1	0

high percentage of agreement and particularly *strong agreement* would necessitate the acceptance of the statement as a basic principle for vocational educators to follow in administering a program.

10. *Head administrators of comprehensive area vocational schools should have had special training in administration.*

This statement implies that successful administrators attain the position because of intent and concern for good school administration. The present head administrators of area vocational schools in Kentucky have no such training except that which might be considered as on-the-job training prior to their having accepted the position. Most of them have had previous experience as teacher-coordinators.

The respondents were definite in their acceptance of the statement as shown in Table 11.

The degree of positiveness of acceptance is self-evident with only 9 of the 271 respondents, who had no opinion, disagreeing with the statement. This principle might imply that provisions should be made, either by institutions of vocational teacher education or departments of commerce or management, whereby training in administration may be provided.

TABLE 11

Degree of Acceptance of Statement 10 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	138	124	10	8	1

Trade and industrial teacher educators .	25	15	9	0	1	0
Vocational school administrators. . .	126	63	52	6	5	0
Employers of Kentucky area vocational school graduates. .	64	27	34	2	1	0

The wholehearted acceptance of the statement indicates that it should be a principle that needs consideration in staffing comprehensive area vocational schools.

11. *Provision should be made for supervision of the instructional program in the school.*

The meaning of the word "supervision" has a different connotation from the sense in which it is generally used, especially as it is applied in industry. In education, the term refers to that function of administration which seeks to improve an instructional staff. This would imply that vocational school programs must be kept up-to-date through aid provided by some person or persons responsible for helping teachers with their problems. Table 12 shows the total acceptance of this statement.

The unanimity of the total group seems to be significant in the acceptance of the statement. The complete meaning of the statement may have been unclear to some of the lay group (employers), thus resulting in the 4 "no opinions."

Because of the degree of the acceptance of the principle it would appear almost mandatory that supervision be included in the administrative program of every vocational school.

12. *The function of supervision is concerned with program development and improvement.*

It was thought that the modern concept of school supervision may have got confused with the "overseer" concept. However, the respon-

TABLE 12

Degree of Acceptance of Statement 11 by Total Group and Subgroups

Group	Number Responding	Response

Employers of Kentucky area vocational school graduates. .	64	28	32	4	0	0

dents almost completely accepted the statement. Table 13 shows this acceptance.

Employers were more conservative in accepting the statement than the other subgroups, probably because the statement was foreign to their experiences. However, the overwhelming agreement with the principle would indicate that the purpose of school supervision is known and accepted.

TABLE 13

Degree of Acceptance of Statement 12 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree

Employers of Kentucky area vocational school graduates. .	64	16	37	8	2	1

13. *Continued teacher development is a necessary part of program development.*

This statement emphasizes the importance of instruction in vocational education. The need for supervision is inherent in the statement. As in all phases of education, the success of the program depends upon the competency of the teachers. In order for teachers to be competent, their continued growth is necessary. This fact is definitely brought out in the acceptance of the principle, as shown in Table 14.

TABLE 14

Degree of Acceptance of Statement 13 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	199	78	4	0	0
Agriculture teacher educators	56	43	12	1	0	0
State supervisors of industrial education	10	8	2	0	0	0
Trade and industrial teacher educators .	25	22	3	0	0	0
Vocational school administrators. . .	126	97	29	0	0	0
Employers of Kentucky area vocational school graduates. .	64	29	32	3	0	0

Only on one other of the 60 statements which were used was there stronger agreement. This decisiveness prevailed in all the subgroups except the employers who, again, were more conservative in their agreement. However, none disagreed. Lack of more strong agreement by this subgroup probably was caused by incomplete understanding of the statement by these lay persons. Trade and industrial teacher educators and agriculture teacher educators answered as might be expected, as their tasks consist mainly of teacher development.

14. *Supervision is an accepted responsibility of school administration.*

Many people in general education would say that supervision is effective to the extent that it is recognized by school administrators as necessary for effective school programs. The reason for including this statement in the study was to find out whether people in vocational education would make the same assertion. If they did, the statement could then be used as a guiding principle for allocating administrative

responsibilities to vocational school administrators. Table 15 shows the extent of acceptance of the statement by the total group and subgroups.

Again, the most conservative of the subgroups was the employers, while the strongest agreement was by the trade and industrial teacher

TABLE 15

Degree of Acceptance of Statement 14 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	126	132	12	10	1
Agriculture teacher educators	56	24	24	2	5	1
State supervisors of industrial education	10	5	4	0	1	0
Trade and industrial teacher educators .	25	16	9	0	0	0
Vocational school administrators. . .	126	64	56	4	2	0
Employers of Kentucky area vocational school graduates. .	64	17	39	6	2	0

educators. Both of these groups might be expected to take these positions because of association or lack of association with such a theoretical statement. However, the 5 disagreements by the agriculture teacher educators cannot be explained by this reasoning because they, too, are familiar with educational theory. The 258 "agreements" and only 11 "disagreements" and 12 "no opinions" would appear to be highly significant. Therefore, the statement should be considered by the group as a sound principle in determining the placement of responsibility for supervision.

15. *The competent worker as a potential teacher is not aware of the content of his occupation, nor is he generally able to develop courses of study from it.*

This statement, made by a noted author and professor, would imply that help must be had if the skilled worker is to be made an effective teacher. Such aid may find its source in supervisors or teacher educators or some other person skilled in developing teacher materials. The statement might have been worded differently so as to escape the "doubleness" in it.

The writer, in his experience as a teacher educator, finds the state-

ment to be very true. He has encountered few, if any, tradesmen who have recently "turned" teachers who can organize the content of their occupations in a satisfactory manner for teaching. This fact should not be considered as a reflection on the ability of the particular individuals or the lack of knowledge about their occupation. They are merely not accustomed to thinking of their trades as subjects for teaching.

The high amount of rejection for this statement as compared to the other principles is reflected in Table 16.

The highest agreement came from the trade and industrial teacher educators (88 percent) which was significant at less than the .01 level while the least agreement came from the state supervisors of trade and industrial education (60 percent). For this subgroup the level of significance was .15 and therefore unnacceptable. High acceptance by the teacher educators is probably a reflection of their extensive efforts made in aiding competent tradesmen to organize their teaching materials—they may see the problem more clearly. No explanation can be given as to why the state supervisors were the most in disagreement, unless it may be that they were the subgroup farthest from the problem. The employers, also removed from the problem, gave acceptance

TABLE 16

Degree of Acceptance of Statement 15 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	36	133	22	75	15
Agriculture teacher educators	56	8	24	7	13	4
State supervisors of industrial education	10	2	4	0	3	1
Trade and industrial teacher educators .	25	4	18	0	2	1
Vocational school administrators. . .	126	20	59	3	37	7
Employers of Kentucky area vocational school graduates. .	64	2	28	12	20	2

which was significant only to the .17 level and, therefore, unacceptable.

Even though disagreement was greater for this statement than for previous principles, the divergence of observed from expected results for the total group was sufficiently large to be significant at less than

the .01 level. Therefore it may be accepted as a principle for guiding supervisors, teacher educators, and others in providing a particular kind of help for new teachers. Because of the amount of disagreement among some of the subgroups, it would seem that much could be expected from competent workers in the organization of their courses.

16. *Every vocational administrator should make use of a formal administrative advisory committee.*

Much has been written and "preached" about the desirability of advisory committees, both at the administrative level and craft level. In some places in Kentucky these types of committees are used; in some places they are not used. Those who do not use advisory groups seem to think they would be a burden and difficult to work with. This statement is included in the study so as to determine the extent of desirability of advisory committees for any newly proposed type of institution. Table 17 shows the acceptance of the statement.

TABLE 17

Degree of Acceptance of Statement 16 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	115	133	12	18	3
Agriculture teacher educators	56	22	30	2	1	1
State supervisors of industrial education	10	6	3	0	1	0
Trade and industrial teacher educators .	25	16	8	0	1	0
Vocational school administrators. . .	126	51	63	1	10	1
Employers of Kentucky area vocational school graduates. .	64	20	29	9	5	1

Even though 199 vocational educators agreed with the use of administrative advisory committees, 15 did not agree. Of those who did not agree, 11 were vocational school administrators (10 percent), the persons for whom administrative advisory committees were designed.

Because advisory committees provide an opportunity for lay persons to influence school activities, it may appear surprising that 6 employers disagreed (10 percent) and 9 employers had no opinion about the statement. The acceptance of the statement is extensive

enough for it to be a principle to be followed by vocational school administrators.

17. *The only reliable source of content for specific training in an occupation is in the experience of masters of that occupation.*

This statement, taken from the writings of a vocational education philosopher, would, if true, have more implications for trade and industrial education than for the other branches of vocational education. If accepted, it would necessitate a more cooperative working arrangement between craftsmen and vocational school personnel in planning for both day and evening classes. Because much of the accepted content of agriculture and home economics education is derived from experimental work performed at experiment stations or laboratories, the statement may not be so applicable.

This statement brought greater disagreement than any of the other statements. It will be noted that much disagreement was consistent throughout all subgroups (except that of state supervisors), being greatest among the agriculture teacher educators. The state supervisors agreed at a ratio of 9 to 1.

The respondents as a group answered the statement negatively, as shown in Table 18.

TABLE 18

Degree of Acceptance of Statement 17 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	46	97	12	112	14
Agriculture teacher educators	56	5	13	4	26	8
State supervisors of industrial education	10	4	5	0	1	0
Trade and industrial teacher educators .	25	5	9	0	10	1
Vocational school administrators. . .	126	22	47	4	50	3
Employers of Kentucky area vocational school graduates. .	64	10	23	4	25	2

In determining final acceptance on a basis of "agree" and "not agree" the agreement is significant at only the .18 level. Therefore, the statement must be rejected as a guiding principle.

18. *Advisory committees should be used for each of the vocational course offerings.*

The same qualifying comments might be made about this statement that were made about number 16. "Craft" advisory committees have long been considered as not only desirable but almost mandatory if an industrial education program is to be successful. This type of committee would also be applicable to the various programs of agriculture, home economics, distributive education, or business education.

The subgroup giving strongest acceptance was the state supervisors of trade and industrial education, 80 percent of whom approved it. Employers, again, viewed the statement conservatively. It is possible that they did not fully understand the statement. Table 19 shows how the respondents accepted this statement.

Probably the most significant fact about Table 19 is the number of agriculture educators who rejected the statement. Of those having opinions, 33 percent rejected the principle (acceptance significant at the .015 level). Even though there was some disagreement among agriculture teacher educators, the total acceptance was significant at less than the .01 level, and thus the statement is accepted as a principle for use in providing efficient program of vocational education. Further study might be given as to the values of using such advisory committees for agriculture education courses.

19. *The State Department of Education should be more advisory than administrative in its actions with an area school.*

This statement has particular significance for many states that are

TABLE 19

Vocational school administrators. . .	126	35	73	3	13	2
Employers of Kentucky area vocational school graduates. .	64	5	33	14	11	1

introducing area schools in their vocational program. It has philosophic implications concerning the question of "state operated" schools versus "area operated" schools. Many of the respondents recognized these implications, as exemplified in Table 20.

TABLE 20

Degree of Acceptance of Statement 19 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	84	127	22	43	5
Agriculture teacher educators	56	19	20	4	12	1
State supervisors of industrial education	10	2	2	1	4	0
Trade and industrial teacher educators .	25	8	13	1	3	0
Vocational school administrators. . .	126	49	55	7	13	2
Employers of Kentucky area vocational school graduates. .	64	6	36	9	11	2

Percentage of acceptance of the statement by the respondents of the subgroups who had opinions ranged from 55 percent (not significant) for the state supervisors to 87 percent for trade and industrial teacher educators. Vocational school admistrators reacted positively to the statement by 87 percent. This may indicate that the administrators at the local schools would see their efforts as being more effective if more autonomy were provided at the area level. It may also be interpreted that the state supervisors, representing the state departments of education, see the area school as being less effective if there is more direct authority at the area level.

However, the acceptance of the statement by the total group indicates that agreement is significant at the .01 level and that it may be considered a guiding principle.

20. *People eventually make greater use of their schools where there is an orderly arrangement for citizens to participate in planning.*

Much has been written about the need for including lay people on various educational committees. It is felt by the writer that this idea is more theoretical than practical. Nevertheless, this judgement should not negate the theory. Persons associated with vocational education have probably been more aware of the theory than those in other

areas of education. In an attempt to gain a clearer determination of this principle, it was submitted to the respondents in this study. Table 21 gives the reaction of the total group and the subgroups to the statement.

TABLE 21

Degree of Acceptance to Statement 20 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	90	160	16	13	2
Agriculture teacher educators	56	29	26	1	0	0
State supervisors of industrial education	10	4	6	0	0	0
Trade and industrial teacher educators .	25	13	12	0	0	0
Vocational school administrators. . .	126	34	82	5	4	1
Employers of Kentucky area vocational school graduates. .	64	10	34	10	9	2

Agreement with this statement is decisive, with only 15 dissenting. Of those disagreeing, 10 were employers or lay people. This appears difficult to justify, as use of the principle would tend to encourage lay participation in the school. It may be that lay people do not desire participation and would rather leave the operation of the school entirely to school people, but this is doubtful. Ten of this subgroup had no opinion. There was high agreement among the vocational education personnel—217 accepted, 5 rejected, and 6 had no opinion. The statement may be considered as a definite principle for program planning.

21. *The adequacy and effectiveness of programs of vocational education are contingent upon the degree of citizen cooperation and participation in planning and evaluation.*

This statement implies greater dependence upon citizen participation for program success than does statement 20. The acceptance of this statement would make almost mandatory the use of advisory committees and cooperating groups in operating vocational schools. Table 22 shows how the respondents accepted the statement.

The similarity of agreement and disagreement of the respondents for statements 18 and 21 is very great. In considering the implications of the two statements, one may see that action implied in statement 21

TABLE 22

Degree of Acceptance of Statement 21 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	55	155	28	41	2
Agriculture teacher educators	56	21	30	0	4	1
State supervisors of industrial education	10	2	5	3	0	0
Trade and industrial teacher educators .	25	9	15	0	1	0
Vocational school administrators. . .	126	21	70	17	18	0
Employers of Kentucky area vocational school graduates. .	64	2	35	8	8	1

would result in advisory committees mentioned in statement 18. Comparison of answers to the two statement would reveal the following similarity:

For statement 18 there 210 acceptance, 48 rejections, and 23 "no opinions."

For statement 21 there were 210 acceptances, 43 rejections, and 28 "no opinions."

Only the state supervisors showed no rejection of either statement. Again the employers showed a reluctance to give significant acceptance to a principle that would involve lay participation. This fact may reflect much misunderstanding or lack of knowledge among lay persons as to their opportunities and responsibilities for participating in programs of vocational education.

The over-all acceptance of the statement is significant to the extent that it should be a principle to be used in effective vocational education programs.

22. *A counselor must be concerned with aspects of the student that are outside his vocational education needs.*

The purpose of including this statement in the study is an attempt to determine the extent of over-all concern for students in vocational education by persons responsible for their vocational education programs. Some have said that vocational educators have been narrow in concepts in caring for the over-all needs of their students. Rejection of the subject statement by the respondents would tend to concur with

this criticism, implying that counseling should be limited to occupational concern. Acceptance of the statement would tend to refute the criticism and would imply that vocational educators are concerned with the welfare of the "total" individual. The acceptance would also serve as a guiding principle in staffing area vocational schools with persons skilled in areas other than mere vocational information. Table 23 shows the degree of acceptance of the statement.

TABLE 23

Degree of Acceptance of Statement 22 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	97	163	11	7	3
Agriculture teacher educators	56	23	29	3	1	0
State supervisors of industrial education	10	4	6	0	0	0
Trade and industrial teacher educators .	25	10	13	2	0	0
Vocational school administrators. . .	126	45	72	3	3	3
Employers of Kentucky area vocational school graduates. .	64	15	43	3	3	3

The extent of acceptance of the statement clearly indicates that it should be a basic principle in caring for needs of students and implies that vocational educators are concerned for the general welfare of their students. Indeed, it would be difficult to separate social, physical, or economic needs from vocational education needs. "Individuals come in wholes, not in parts," and vocational education, according to the responses to the subject statement, is concerned with the whole person.

23. *In each school someone should coordinate all the various guidance activities and furnish leadership in improving guidance services*

This implies that the statement, "everybody's business is nobody's business," is true and that leaving matters to everyone is not the correct procedure in guidance activities. According to the writer's personal knowledge the "everybody's business" is too prevalent in the area vocational schools in Kentucky. It is felt that guidance activities are more "talked about" than "done anything about." The respondents'

reaction to the subject statement should enable the researcher to determine the collective opinion as to whether an individual directly responsible for guidance activities should be associated with the area vocational school. No guidance counselors are now so employed. The respondents gave wholehearted acceptance to the statement as shown in Table 24.

TABLE 24

Degree of Acceptance of Statement 23 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	133	145	2	1	0
Agriculture teacher educators	56	31	25	0	0	0
State supervisors of industrial education	10	2	8	0	0	0
Trade and industrial teacher educators .	25	19	6	0	0	0
Vocational school administrators. . .	126	63	62	0	1	0
Employers of Kentucky area vocational school graduates. .	64	18	44	2	0	0

The almost total group acceptance of this principle would make it axiomatic in the operation of an area vocational school. Few of the 60 statements under study were more completely accepted. Considering such positive reaction the reader (as does the writer) may wonder why the principle has not been acted upon.

24. *Effective vocational education for any profession, calling, trade, occupation, or job can only be given to the selected group of individuals who need it, want it, and are able to profit by it.*

This statement points up the need for selection of students who enroll in programs of vocational education. Some people in education see vocational education as the "answer" for the slow learner, the incorrigible, the dropout, the uninterested, and the general ne'er-do-well. It is probably true that vocational education can do much for many of these. However the subject statement would intimate that these individuals (and others) would need to have certain qualifications if the efforts of vocational education are to be effective. Table 25 reflects the degree of acceptance of the respondents for this assertion.

TABLE 25

Degree of Acceptance of Statement 24 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	145	114	4	18	0
Agriculture teacher educators	56	28	22	1	5	0
State supervisors of industrial education	10	7	3	0	0	0
Trade and industrial teacher educators .	25	15	8	0	2	0
Vocational school administrators. . .	126	65	53	1	7	0
Employers of Kentucky area vocational school graduates. .	64	30	28	2	4	0

The total group's acceptance is quite decisive. However, the possibility of a more general approach in enrollment practices in the future may have merit. At present a plan of selection for student enrollment in programs of vocational education should be a principle to be followed.

25. *Vocational education will be effective in proportion to the degree that it enables each individual to utilize his interest, aptitudes, and intelligence to the highest possible degree.*

This statement implies that every individual is an entity and that individual treatment must be accorded to each. In order to provide this treatment, it is necessary that inventories of aptitudes and learnings be made, that knowledge of progress be known by both student and the teachers, and that each student be made to realize his worth. Table 26 shows the reaction of respondents to these implications. Acceptance of this principle implies guidance and counseling services, well-equipped shop laboratories, and a dedicated school staff. As stated in the principle, vocational education will be effective to the extent that students reach their potential. To gain this potential, facilities and services must be adequate. The wide acceptance of this statement by the panel indicates it as a principle to be followed.

26. *The fact that a youth of the smaller community goes elsewhere to pursue an occupation should not deprive him of help in selecting it intelligently, of training for it, or of aid in securing employment in it.*

TABLE 26

Degree of Acceptance of Statement 25 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	129	141	7	4	0
Agriculture teacher educators	56	26	28	2	0	0
State supervisors of industrial education	10	7	3	0	0	0
Trade and industrial teacher educators .	25	16	9	0	0	0
Vocational school administrators. . .	126	59	65	0	2	0
Employers of Kentucky area vocational school graduates. .	64	21	36	5	2	0

As shown in Chapter I, the mobility in Kentucky is high. The probability exists that this trend will continue at least for the next decade. The subject statement would imply that the migrating youth, because he comes from the smaller community, should not be discriminated against in his guidance, training, and job placement, but that he would make a greater contribution to society if his individual employment needs were satisfied. Table 27 shows almost total acceptance of the principle.

TABLE 27

Degree of Acceptance of Statement 26 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	156	122	2	1	0
Agriculture teacher educators	56	34	21	0	1	0
State supervisors of industrial education	10	7	3	0	0	0
Trade and industrial teacher educators .	25	17	8	0	0	0
Vocational school administrators. . .	126	70	55	1	0	0
Employers of Kentucky area vocational school graduates. .	64	28	35	1	0	0

A greater concern for caring for the occupational needs of all youth seems to have found a new importance in the thinking of many people. The agreement with the subject principle shows the stress which both vocational education leaders and employers are placing on this philosophy.

The statement should be considered a definite principle to follow for a sound program of vocational education.

27. *In every community there are youths and adults out of school who need vocational guidance as much as, or perhaps more than, those still in school.*

If this statement is true, one may ask where and by whom will these people receive this guidance. No vocational school in Kentucky provides this service, and probably few, if any, schools of general education enable out-of-school people to receive such counseling. However, the statement is being studied to determine if, in the thinking of the respondents, there are such needful individuals.

Employers of Kentucky area vocational school graduates. .	64	33	31	0	0	0

Only three respondents had "no opinion" about the statement. The high degree of *strong* agreement is significant in itself. One would conclude that vocational guidance services for out-of-school youth and adults are, to some degree, seriously needed. The question poses itself—"Should this be a service of area vocational schools?" The extent of agreement of the respondents might imply that it should be.

28. *Class personnel should make tentative occupational choices on the bases of their interests, capacities, and the requirements of the occupations.*

This statement, in essence, says that the student should decide on his occupation on the basis of knowledge which he has regarding his abilities, of awareness of the content of his occupational choice, and of the coincidence of his interests with this knowledge. The question of where or how he is to obtain this information is not implied, but if the subject statement were accepted as a basic principle the question would arise. The soundness of the statement is indicated in Table 29.

TABLE 29

Degree of Acceptance of Statement 28 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	93	167	15	6	0
Agriculture teacher educators	56	24	29	2	1	0
State supervisors of industrial education	10	3	5	2	0	0
Trade and industrial teacher educators .	25	8	16	1	0	0
Vocational school administrators. . .	126	41	73	8	4	0
Employers of Kentucky area vocational school graduates. .	64	17	44	2	1	0

The high degree of agreement with the statement indicates acceptance by the respondents as a principle. As previously stated, the question arises as to how potential class personnel will have this needed information. The response, as indicated in statement 28, incates little doubt in either the school groups or the lay group that enrollees should "know" what they are doing. How this might be done is discussed in the next chapter.

29. *Specialists should be responsible for special areas of instruction.*

This statement implies that teachers should be comptetent in their areas to the extent that they would be recognized by others in their field as proficient to a high degree. It might also imply that persons who work in supervisory capacities should be recognized in a like

manner. If this principle were accepted, it should serve as a guiding principle for staffing. Table 30 shows the extent of agreement by the various groups.

TABLE 30

Degree of Acceptance of Statement 29 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	100	164	9	7	1
Agriculture teacher educators	56	19	31	1	4	1
State supervisors of industrial education..	10	5	4	1	0	0
Trade and industrial teacher educators .	25	11	14	0	0	0
Vocational school administrators. . .	126	47	73	3	3	0
Employers of Kentucky area vocational school graduates. .	64	18	42	4	0	0

Some of the agriculture teacher educators may have had difficulty in interpreting the statement. Their five disagreements might so indicate. The employers, being aware of needs for specialists, showed more certainty than usual in their agreement. However, all groups seemed to recognize this need and significantly agreed with the statement. Its consideration as a principle should be included in the guidelines for staffing.

30. *Provisions should be made in the area school to take care of the basic educational needs of people so that they may profit from the vocational training requiring those basic skills.*

This statement reflects the thinking of some vocational educators during the past few years. It is a departure from the general idea of "pure and simple" trade teaching. What is "basic" to vocational training could vary from the simplest skills in reading, writing or arithmetic to calculus or physics. The question arises as to whether the vocational school should become more active in providing for these needed educational activities (usually considered as activities of general education) or refrain from providing them and require the enrollees to be competent in them before enrollment. One might then ask: If the enrollee doesn't possess the required skills but needs vocational training, how and where will he obtain the skills? Most of the area vocation-

al schools in Kentucy teach mathematics, science, and drawing as they relate to the students' objective. However, these related subjects are generally not at primary level. Present Federal acts pertaining to vocational education would encourage the teaching of the more-basic skills. Table 31 shows the extent of agreement of the respondents to this question.

TABLE 31

Degree of Acceptance of Statement 30 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	112	144	10	13	2
Agriculture teacher educators	56	25	26	2	2	1
State supervisors of industrial education	10	3	5	2	0	0
Trade and industrial teacher educators .	25	10	12	0	3	0
Vocational school administrators. . .	126	58	60	2	6	0
Employers of Kentucky area vocational school graduates. .	64	16	41	4	2	1

There seems to be little doubt by the panel of experts that basic education should be included in the program of vocational education. The vocational school administrators group (those working at the local level) apparently can see this need more clearly than the other subgroups. Their acceptance of the principle by an agreement of 118 to a disagreement of 6 might appear to be even more meaningful than that of the state supervisors who had no disagreement.

Thus it may be said that the statement should be considered a valid principle in determining vocational school offerings.

31. *Vocational education will render efficient social service in proportion to how well it meets the specific training needs of any group at the time they need it and to the extent it is given in such a way that they can most effectively profit from the instruction.*

This statement implies that vocational education must not be rigid or stereotyped. The time of the year or the day would be of no consequence if the services were meeting a need. Programs would be arranged according to learner needs and not for administrative con-

venience. There are also implications that these programs may be carried on outside the confines of the vocational school complex. The respondents accepted the statement, as shown in Table 32.

TABLE 32

Degree of Acceptance of Statement 31 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Disagree
Total group	281	99	159	21	2	0
Agriculture teacher educators	56	20	31	5	0	0
State supervisors of industrial education	10	3	7	0	0	0
Trade and industrial teacher educators .	25	10	15	0	0	0
Vocational school administrators. . .	126	51	64	0	0	0
Employers of Kentucky area vocational school graduates. .	64	15	42	6	1	0

By showing only two disagreements the group indicates significantly high acceptance of the statement as a principle for organizing vocational classes. They are saying, in effect, that a class session in agriculture may be held in a barn, or a field, and that a class session of home economics may be held in a restaurant kitchen. Their answers state that the "ends justify the means."

32. *For every occupation there is a minimum of productive ability which a person must possess in order to secure (and retain) employment in that occupation. If vocational education is not carried to that point with the individual, it is not effective.*

This statement would imply that the vocational needs of people cannot be half met and be effective. It appears to fall in the category of the "pretty good egg"—which no one wants. The idea would have implications for length of course, as well as clear objectives and knowledge of content of occupations for which courses were being offered. It would also intimate that programs should be organized so as to permit their completion by those enrolled. Table 33 shows the extent of agreement by the panel for these implications.

Even though the agreements for the total group and for all subgroups are significant to a level of less than .01, and the statement therefore can be considered as definitely a valid principle, one may be

concerned by the number of disagreements, particularly those of the vocational school administrators. As these persons have a more direct contact with enrollees, they may see certain concomitant learnings that are valuable for the occupationally inadequate student. Future studies may reveal effectiveness of these learnings. However, for the present, this research would tend to indicate that enrollment in courses that produce occupationally incompetent people is not justified.

33. *A school designed to meet the occupational needs of people should be so organized and conducted that it is able to admit applicants at any time class vacancies exist.*

This statement is somewhat controversial, as indicated by the panel of experts. It may tend to imply that enrollees in vocational courses progress at their own ability rates and that new enrollees may enter the group with profit to themselves and without damage to others. It would also indicate that individual instruction is being carried on to a high degree. There may be a number of additional implications as well as a number of reasons why the procedure would be inept. Table 34 shows the division of opinions among the respondents.

The response shows a wide range of thinking. Statistically, on a basis of agree-disagree, the acceptance of the state supervisors was

TABLE 33

not significant. The acceptance of the remaining subgroups was significant at the .01 level with the exception of the vocational school administrators which was significant at the .02 level. It may be of interest to note that the state supervisors would be further removed from the

TABLE 34

action to which the subject statement refers than probably any other subgroup, yet they were the only subgroup that refused to accept the statement. The thinking reflected in the statement may not be applicable for some vocational education courses, while for others it may be the most expedient way of organizing the classes.

The statement stands as a guiding principle to be used in those courses where applicable. These courses would possibly be those where manipulative skills, as the learning to be secured, predominate.

34. *Stress should be given to individual and small-group instruction in teaching.*

Many persons in education advocate large groups in teaching-learning; others believe students learn better by individual or small-group learning. Vocational education classes have usually been smaller than general education classes, probably as a result of safety considerations, as well as the nature of the content of the course. Implications in the statement would be that the number of instructors would be greater, and more equipment would be required. This would mean larger budgets for instruction and capital outlay.

Some disadvantages that might accrue, other than taxing a teacher's time, would be the limitation of student interaction within the group thereby lessening those social learnings which many consider to be desirable. The degree of acceptance of the statement by the respondents is shown in Table 35.

The almost complete acceptance of this statement by the total

TABLE 35

group appears to be inconsistent with acceptance of statement 33 with which there was a much lower degree of acceptance. In statement 34, the group accepts wholeheartedly the idea of individual and small-group instruction.

Statement 34 should be considered definitely a principle to follow in classroom procedure.

35. *Courses in the area should be justified on the basis of satisfying needs in this order:* (A) *area needs,* (B) *state needs, and* (C) *out-of-state needs.*

This statement implies that vocational education should be concerned with training needs regardless of where the trainee will apply his skills. One of the bases on which Federal subsidy is given is that it alleviates labor shortages by causing skilled people to migrate to areas in which these shortages exist. The statement under study would imply that local needs should first be cared for, then needs in the particular state, and, lastly, needs elsewhere. Table 36 reflects the thinking of the panel of experts on the statement.

The degree of acceptance of the state supervisors was not sufficient to be significant. However, the acceptance of each of the other subgroups was significant, as well as that of the total group. This fact may result from a more "over-all" concept of the needs for skilled people which persons on the state level may have.

The acceptance by the respondents would cause the statement to become a principle to be used by vocational school administrators in

TABLE 36

Degree of Acceptance of Statement 35 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	107	149	11	11	3

Employers of Kentucky area vocational school graduates. .	64	21	39	1	2	1

considering courses which should be started and courses which should be closed to meet needs on an area, state, or local level.

36. *Because of the increase in population, vocational education must make provision for increased services.*

The statement implies that services must expand, if for no other reason, to care for more people. Some persons have been critical of increased funds to be used for vocational education. It would seem that, because of increases in population, these services must increase. The respondents agreed to the subject statement as shown in Table 37.

Acceptance to a high degree by all subgroups would indicate there should be continuous expansion of vocational education services in order to provide for the increasing population. The number of those having no opinion seems disaproportionately high when the "disagrees" are so few. On only one other statement under study was there a higher ratio. The employers with no opinion (and who disagreed) may have seen a need for apprenticeship to care for increasing occupational training needs of the increasing population.

37. *Vocational classes for in-school youth should provide for promotion on the basis of performance.*

Nearly all classes for in-school youth are set up on a semester basis and, it is feared, too many times promotion is dependent upon time spent rather than objectives attained. The statement under study would imply an "ungraded" type of promotion—the student advances as he becomes proficient in performance. It also implies more individ-

TABLE 37

ual instruction, as the enrollees advance at their own rates. It may also intimate that there will be greater interest from the brighter students who will not be detained by the slower and less frustration of the slower learners who attempt to keep pace with the brighter. Table 38 shows how the respondents accepted the statement.

The panel's extent of acceptance is high, with only five disagreements. If the principle is practiced in vocational education classes, it should not only bring about changes in teaching procedures and stu-

TABLE 38

dent benefits previously listed, but it may cause problems of scheduling for the local high-school principal when he has students who complete their vocational courses before the semester ends.

38. *All youth should develop salable skills, understandings, and attitudes that make the worker an intelligent and productive participant in economic life.*

This statement implies that all should "work." It may be work of a white-collar nature or of a blue-collar nature, but all should contribute through work. If all youth are to behave intelligently, and be productive, this would probably mean that, for most, many of these learnings should be secured during their high-school years. Provision would need to be made to meet these requirements—vocational education for those who most generally will go to work upon graduation and college preparatory curriculums for those who will enroll in institutions of higher learning. The respondents viewed the statement in the manner indicated in Table 39.

Agreement with the statement is high. The disagreements would be difficult to explain, unless the use of the word "all" has a subtle way of bringing about disagreements by some people. Application of the principle would bring a "new look" to most high-school curriculums.

39. *The comprehensive area vocational school should function as a cooperating institution with high schools in the area and should not be a competitive institution.*

TABLE 39

Degree of Acceptance of Statement 38 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	142	129	3	5	2
Agriculture teacher educators	56	33	21	1	0	1
State supervisors of industrial education	10	4	5	0	1	0
Trade and industrial teacher educators .	25	18	7	0	0	0
Vocational school administrators. . .	126	67	56	1	1	1
Employers of Kentucky area vocational school graduates. .	64	20	40	1	3	0

The comprehensive area vocational school would be a complement to, not a substitute for, the existing high school. It would give no high-school diploma but high-school credit would be given by the high schools for courses in which students enrolled. Table 40 shows the high degree of acceptance of the subject statement.

TABLE 40

Degree of Acceptance of Statement 39 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	206	65	7	3	0
Agriculture teacher educators	56	42	11	3	0	0
State supervisors of industrial education	10	6	4	0	0	0
Trade and industrial teacher educators .	25	20	5	0	0	0
Vocational school administrators. . .	126	93	28	4	1	0
Employers of Kentucky area vocational school graduates. .	64	45	17	0	2	0

More of the respondents strongly agreed with statement 39 than with any other statement in the study. Thus, the panel does not see an area vocational school as a substitute for the present high school but a cooperative institution doing what the individual high school cannot adequately do.

40. *An institution which attempts to care for the occupational needs of out-of-school youth and adults should be organized so that it can admit persons with a wide range of academic training.*

This statement would imply a wide selection of courses, and programs of varying lengths. It may also imply that basic education be provided for those who need these skills so that they may profit from their occupational training. The institution would need to be versatile in its occupational training. It would need to be diversified as to occupational areas; i.e., industrial, agricultural, home economics, business, and sales. Table 41 shows the degree of acceptance of this proposal.

The panel indicates acceptance of statement 40. It is saying that a comprehensive area vocational school should be broad in its views

TABLE 41

of program and student selection. It may be noted that four of the five who had "no opinion" and seven of the 10 who disagreed were employers. However, it is significant that in the vocational school administrators group, persons who are directly associated with caring for occupational needs of people, only two disagreements were recorded.

41. *Adults enroll in vocational courses because they know what they want and they expect to learn that which they want.*

It is generally thought that adults are more decisive about their desires, probably because of more extensive experiences they have had. High school youths, lacking in experiences, are less decisive and often change their objectives during enrollment. The statement implies that adults enroll in classes for a definite purpose—to get information or skill which they seek. Table 42 shows the degree of acceptance of the statement.

The panel accepted the statement with less assurance than it had some of the previous statements under study. Percentages of disagreement of those having an opinion of each of the subgroups were: agriculture teacher educators—18 percent; state supervisors—11 percent; industrial teacher educators—18 percent; vocational school administrators—10 percent; and employers—36 percent. The employers showed the greatest doubt that adults knew what they wanted when they enrolled for occupational training. Explanations for this trend of thought are difficult to propose. Conservative thinking by this subgroup may have arisen from experiences which some may have had in

Soiho 111

TABLE 42

the hiring of unskilled persons who were initially interested in learning on-the-job but who, for some reason, failed to continue in their employment. However, the extent of agreement is significant to less than the .01 level for the total group and for each subgroup; thus the statement under study may be considered a general principle.

42. *Adults are more likely to enroll in short-unit courses than in long-term courses.*

Throughout the years many vocational courses designed for adults have been organized to require two years from the starting dates for completion. Some maintain that this length of course discourages many adults from enrollment. They say that adults usually have many responsibilities which youth do not have and these pressing needs prevent them from setting aside such large blocks of time. This group would also argue that, in most cases, the large over-all occupational objective can be divided into smaller objectives which will be acceptable to most adult enrollees—the sum of these smaller objectives being the large objective. The thinking of the panel concerning this rationale is shown in Table 43.

According to the respondents' answers, they agree with the statement under study, even though a time span is not given for "short-term" or "long-term." Apparently most, if not all, of the vocational school administrators have had experience with long-term courses as well as the short-term courses. It would seem that their responses would be particularly valuable in determining the plausibility of the

TABLE 43

Vocational school administrators. . .	126	46	67	7	5	1
Employers of Kentucky area vocational school graduates. .	64	5	48	10	0	1

statement. The principle should contribute much to the thinking of those who have responsibility for organizing classes of a preparatory nature and evening-extension classes.

48. *The great mass of adult workers attending upgrading classes look to the vocational school for the technical, rather than the manipulative, side of their occupation.*

This statement presumes that workers have greater difficulty in keeping pace with informational and concept improvement than with hand-skill improvement. Supposedly, manipulative skills do not change as rapidly, nor as radically, and when such changes do occur they can generally be learned on the job. The degree of acceptance of this thinking is shown by the panel's response in Table 44.

Only on one other statement in the study was there more disagreement than on this one. Also, only one other statement drew as many "no opinions" from the respondents. This may indicate a need for further investigation by those responsible for organizing upgrading-type classes. Probably the statement is a general truth but not one which would apply to every class. For example, welding with inert gases may not be applicable. However, on the basis of agree-disagree, the acceptance is significant for the total group and for each subgroup to a level of less than .01 with the exception of the agriculture teacher educators whose acceptance was significant at the .035 level.

The subject statement may be accepted as a guiding principle with slight reservation.

TABLE 44

Degree of Acceptance of Statement 43 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree

Employers of Kentucky area vocational school graduates. .	64	6	40	13	5	0

44. *It is increasingly difficult for the worker to keep up with what he must know and do in his work.*

Much has been said regarding changing technologies and the difficulty of obtaining persons qualified in manning modern machines and performing tasks which require particular knowledge. If the subject statement is true, it would imply that the organization of classes designed for upgrading workers should be accelerated. It may also imply the need for a constant survey and revision of course content for classes that are generally operated on a continuous basis. In addition, it has implications for increased advisory committee activity. Table 45 shows how the respondents viewed the statement.

As shown in the table the panel accepted the statement with little reservation. However, 28 percent of the employers either disagreed or had no opinion. Also in this same subgroup, there was a smaller percent of "strong agreement" than in the other subgroups.

The statement may be accepted as a guiding principle with the implications previously mentioned.

45. *Because of technological developments, the need for workers to be retrained will increase.*

This statement correlates with the three preceding statements under study. It implies an ever-increasing effort by vocational education personnel to meet these needs. It may also imply that there is no indication technological development will cease or slow down. Table 46 shows the degree of acceptance by the panel.

TABLE 45

Degree of Acceptance of Statement 44 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	82	168	12	19	0
Agriculture teacher educators	56	19	32	2	3	0
State supervisors of industrial education	10	4	5	1	0	0

Vocational school administrators. . .	126	42	77	2	5	0
Employers of Kentucky area vocational school graduates. .	64	6	40	7	11	0

According to 99 percent of the respondents the statement may be considered a basic truth. This truth should aid in making decisions on expansion of vocational education facilities because the tendency toward increased need for training will be greater.

46. *The occupational needs of workers are spread over many occupational areas. For example, the farmer has needs related to mechanics and marketing; the saleslady has needs related to home economics; etc.*

TABLE 46

Degree of Acceptance of Statement 45 by Total Group and Subgroups

Vocational school administrators. . .	126	72	53	0	1	0
Employers of Kentucky area vocational school graduates. .	64	18	39	5	2	0

The feeling exists among some people that activities in the various areas of vocational education have been too narrow. This narrowness may have been more justified during the early years of vocational education when occupations were less complicated. The statement intimates that occupational needs are more of a conglomerate nature and cannot be "pigeon-holed" as they have been in the past. If this is a correct assumption, vocational education may need to give greater attention to the composite needs of workers. The panel's reaction to the statement is shown in Table 47.

Vocational school administrators. . .	126	38	83	5	0	0
Employers of Kentucky area vocational school graduates. .	64	8	50	4	2	0

It would seem that responses by the employer group would be particularly significant, as they are closer to the labor market than are the other subgroups. Only two of the employers disagreed with the statement. The statement should be considered as a guiding principle in meeting the training needs of workers.

47. *In planning vocational education programs, we should be as concerned, perhaps more, about the needs of the individual as we are about the needs of his potential employer.*

The statement implies that the needs of these two are inseparable when considering vocational education. Two views have been taken in the past: (1) "Vocational education trains for industry," and (2) "Vocational education meets the needs of people." If the first is accepted, less emphasis may be placed on the needs of the individual than indicated in the second, which would include caring for social and personal needs. Table 48 shows how the respondents reacted to the statement.

Even though the acceptance of the total group is significant at less than the .01 level, it appears that the statement brings forth a degree of doubt among the employers. Probably more disagreement among

TABLE 48

Vocational school administrators. . .	126	39	71	5	10	1
Employers of Kentucky area vocational school graduates. .	64	7	32	7	17	1

this subgroup could have been expected as some may think of employer first and individual second.

48. *Vocational education should continue to provide related instruction to apprentices.*

This activity has been engaged in by trade and industrial education since the passage of the Smith-Hughes Act in 1917. Of the ways which this part of apprentice training may be given, most people consider that which is provided by vocational education to be the most satisfactory. In less populous areas it has been difficult for vocational education to provide this instruction. The panel seems to give wide acceptance to providing related instruction to apprentices to the extent that probably provisions should be made in all geographical areas. This acceptance is shown in Table 49.

Again, it seems significant that the employers are in high agreement with the subject statement, as these persons are the users of workers who are recipients of the instruction. Their agreement implies satisfaction with the service. Acceptance of the statement by the total group would indicate that extensive effort should be made in caring for the related instruction needs of all apprentices in all areas.

TABLE 49

Degree of Acceptance of Statement 48 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree

Employers of Kentucky area vocational school graduates. .	64	9	47	6	2	0

49. *If a vocational education program is meeting the occupational needs of people within its geographical area, its evening-class enrollment should exceed its in-school enrollment.*

This statement implies an extensive need for up-grading, retraining, preparatory, or part-time training in all areas of vocational education. The writer is of the opinion that if home economics alone were meeting the needs of its people, the evening enrollment would exceed in-school enrollment. Table 50 shows how the respondents accepted the statement.

The respondents indicated more "no opinions" on this statement than on any other of the 59 statements under study. The high amount of "no opinions" as listed by the employers might be expected as the statement was technical and their information and thought on the subject would be limited. Their acceptance was significant only to the .05 level. There is a strong possibility that many of the agriculture-teacher educators and, to some extent, the vocational-school administrators, were considering only their own fields when answering the survey instrument.

It would seem that evening classes for persons engaged in distributive and business occupations would prove to be particularly valuable. In consideration of the few who are now served in these occupations, it would appear to be highly desirable for vocational education administrators to implement such courses.

Of those having opinions, the acceptance of the agriculture-teacher

TABLE 50

Degree of Acceptance of Statement 49 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	61	113	67	38	2
Agriculture teacher educators	56	11	21	10	14	0

Trade and industrial teacher educators .	25	5	12	6	1	1
Vocational school administrators... .	126	37	59	16	14	0
Employers of Kentucky area vocational school graduates. .	64	3	17	34	9	1

educators was significant at less than the .02 level. The other subgroups (except the employers) as well as the total group accepted the statement to a significance of less than the .01 level. The use of this principle in vocational education would indicate a strong evening program to meet occupational needs of out-of-school youth and adults.

50. *Vocational education is needed to provide a supplement to apprenticeship.*

There is a possibility that the statement may not have been fully understood by all respondents even though acceptance by the panel compares well with that of statement 48. The subject statement was meant to imply that vocational education would be needed as pre-apprenticeship training rather than related instruction for apprentices. Many employers have considered vocational education as a desirable prerequisite for apprenticeship; others give credit toward apprenticeship for the training received in the vocational school. Table 51 shows how the respondents accepted the premise.

Possibly the 31 "no opinions" reflect some misunderstanding of the statement as this response seems to be general in all subgroups except the state supervisors. The high degree of acceptance of the total group would indicate that the principle is of significance. It should be of particular concern to vocational educators who desire to place graduates in apprenticeable trades.

51. *The public will take advantage of vocational education services in proportion to the knowledge it has about those services.*

TABLE 51

Degree of Acceptance of Statement 50 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	68	167	31	11	4
Agriculture teacher educators	56	9	35	8	4	0
State supervisors of industrial education	10	5	4	0	0	1
Trade and industrial teacher educators .	25	6	12	6	1	0
Vocational school administrators. . .	126	40	71	9	4	2
Employers of Kentucky area vocational school graduates. .	64	8	45	8	2	1

It would seem that the truth inherent in the statement would be self-evident. However, the information the general public seems to lack about this area of education would indicate that either those who are engaged in vocational education are not aware of the need for publicity or the efforts being made to familiarize the public are ineffective. The panel indicated their acceptance of this statement, as shown in Table 52.

Agreement with the subject is highly significant. Probably of great-

TABLE 52

Degree of Acceptance of Statement 51 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree

Vocational school administrators . .	126	58	61	4	3	0
Employers of Kentucky area vocational school graduates .	64	16	41	7	0	0

est importance is the acceptance given by the employers. This subgroup showed no negative reaction. As this is the only lay group in the survey it would seem that their answer is of particuler consequence. Persons responsible for supplying information about vocational education should be well aware of the significance of the statement.

52. *Understanding on the part of the people is vital to the continued financial support of vocational education on the local, state, and national levels.*

Vocational education enrollments are not composed of captive audiences. Students enroll because they attempt to meet their occupational needs. To the degree that people understand the meaning and purposes of the programs, they may expect to support them. The respondents accepted this reasoning, as reflected in Table 53.

TABLE 53

Degree of Acceptance of Statement 52 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	146	127	7	1	0
Agriculture teacher educators	56	37	17	2	0	0
State supervisors of industrial education	10	6	4	0	0	0
Trade and industrial teacher educators .	25	15	10	0	0	0
Vocational school administrators. . .	126	75	50	0	1	0
Employers of Kentucky area vocational school graduates. .	64	13	46	5	0	0

Statement 52 (as well as statement 51) emphasizes the need for widespread understanding of vocational education. Only one respondent disagreed with the statement. If this area of education is providing a needed service and its existence depends on understanding, it would behoove those responsible to consider statement 52 as a principle which should be followed.

53. *Community understanding is vital to teacher morale and to permanence and creativity in the profession.*

This statement implies that social pressures are involved with program understanding—that people like to be associated with those

activities which are acceptable to others. Without job satisfaction teaching would be a difficult vocation for one to follow. The statement intimates that this job satisfaction is dependent upon a knowledgeable community. Table 54 shows how the panel reacted to the statement.

TABLE 54

Degree of Acceptance of Statement 53 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	117	147	16	1	0
Agriculture teacher educators	56	28	26	2	0	0
State supervisors of industrial education	10	5	5	0	0	0
Trade and industrial teacher educators .	25	14	9	2	0	0
Vocational school administrators. . .	126	51	68	6	1	0
Employers of Kentucky area vocational school graduates. .	64	19	39	6	0	0

Almost total agreement indicates that community understanding is necessary for teacher morale. This may not appear as a great discovery in itself, but it adds emphasis to the fact that understanding of vocational education is of prime importance and that such comprehension touches many aspects of the activity. If the people charged with teacher supervision want good programs of instruction, it seems they would be particularly concerned about good teacher morale and they would need to be aware of this principle that reflects community understanding as a prerequisite for morale.

54. *Interpreting the vocational school function to citizens of the area is one of the primary responsibilities of the head administrator of the school.*

This statement does not preclude functions which others may have in promoting this understanding. However, it does intimate that the head administrator has a prime responsibility in this activity, and regardless of how the activity is carried out, the duty is his. Table 55 shows how the respondents accepted this principle.

The respondents indicate a high degree of acceptance of the statement. Particularly significant are responses of the state supervisors and

TABLE 55

Degree of Acceptance of Statement 54 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	125	129	13	11	3
Agriculture teacher educators	56	24	28	1	1	2

Trade and industrial teacher educators .	25	14	9	0	2	0
Vocational school administrators.....	126	63	59	0	3	1
Employers of Kentucky area vocational school graduates. .	64	18	29	12	5	0

vocational school administrators. Both of these subgroups indicate strong agreement. The state supervisors, it appears, would delegate this responsibility to the local administrators (those who would come under state supervision) and the administrators agree that the responsibility is theirs. As shown in the table, the other subgroups concur with the opinions of the state supervisors and the local administrators. It is possible that some of those who disagreed did so because of their interpretation of the statement as meaning exclusive responsibility.

55. *Vocational education activities may be carried on adequately in locations outside the vocational school center.*

To many lay persons, and some associated with vocational education, the thought of profitable programs in locations other than the vocational school itself seems impossible. Because of the belief, many schools limit their activities to those that may be conducted within the vocational school building. The statement does not limit the occupational area nor the level of training which may be engaged in. Many have believed that use of community facilities has been a means of extending vocational services to areas which school facilities could not provide. Table 56 shows the reaction of the respondents to the principle.

Agreement with the statement by the total group and all subgroups is significant at less than the .01 level, thereby establishing the statement as a principle which should be considered by those having a responsibility in organizing classes. Because the employers are farther

disagreement may also have resulted from this fact. The six disagreements (one strong disagreement) indicated by the agriculture-teacher removed from the philosophy inherent in the statement, it is possible that some misunderstanding on their part may have evolved. This possibility is reflected in 17 "no opinions." Their higher percentage of

TABLE 56

Employers of Kentucky area vocational school graduates. .	64	3	32	17	11	1

educators seem significant in consideration of the fact that much teaching of vocational agriculture takes place on the farm (outside the school).

56. *Generally, people who would not travel 25 to 30 miles to attend an evening class would attend the same class if it were held in their immediate community.*

This statement is included in the study in an effort to determine the likelihood of success of classes that might be held in remote areas.

Presently, evening classes in trade and industrial education and classes in distributive education are being held in localities away from the vocational school. In these two educational areas, success seems to be apparent. This success appears to depend entirely on whether the course meets a recognized need of the people in the particular locality. This fact would imply that coordinators should work closely with groups in the outlying sections to ascertain these needs. If vocational education is to be available to all, provision will need to be made for these extended services in all areas. There are some who believe that persons desiring training will avail themselves of it regardless of where

the classes are held. Table 57 shows the range of opinion to be rather widely distributed among the respondents.

Apparently employers have greater doubt about workers' initiative to obtain training than the the other subgroups listed in the table. The vocational school administrators also have some doubt as to the amount

TABLE 57

Vocational school administrators. . .	126	29	68	12	17	0
Employers of Kentucky area vocational school graduates. .	64	9	28	9	16	2

of effort people will expend in upgrading themselves or learning new occupational skills. However, even with the disagreements shown in the table, the total group and all subgroups accepted significantly to a level of less than .01. The acceptance of the principle should cause vocational school coordinators to look beyond the confines of their own buildings to provide courses for persons living within 30 miles of the vocational school.

57. *Probably all communities have individuals who are interested in the promotion of vocational education activities of a given kind in that particular community.*

This statement implies that interest in the promotion of vocational education may be widespread. Acceptance of this statement would have many implications for advisory committees (both craft and administrative), publicity, public relations, student recruitment, and occupational surveys. The statement also contains implications that people are more interested in their own community than they are in areas outside their environs. Table 58 shows the degree of acceptance of this statement by the panel.

TABLE 58

Degree of Acceptance of Statement 57 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree
Total group	281	61	202	16	2	0
Agriculture teacher educators	56	13	41	2	0	0
State supervisors of industrial education	10	2	8	0	0	0
Trade and industrial teacher educators .	25	9	15	1	0	0
Vocational school administrators. . .	126	32	89	5	0	0
Employers of Kentucky area vocational school graduates. .	64	5	49	8	2	0

Almost complete agreement (16 "no opinions") with the statement makes the principle highly significant for vocational school administrators who are responsible for area programs. The administrators themselves voice no disagreement with the statement, only five having no opinion. With the knowledge that there is interest in vocational education in all communities, administrators should envision vocational education horizons as extending far beyond their immediate buildings.

58. *Vocational education should use the services of other agencies in attaining its objectives.*

Not until the past few years did vocational education in Kentucky make much use of other agencies in attaining its objectives. Some personnel in the vocational schools and departments have availed themselves of aptitude tests which are provided by the Department of Economic Security, but other than this service, most cooperation has been "legislated" through the Area Redevelopment Act and the Manpower Development and Training Act. The statement implies that the ends justify the means. The statement and apparent implications are accepted by the respondents, as shown in Table 59.

The few "no opinions" and "disagrees" indicates almost complete acceptance of the statement as a principle to be followed by persons in vocational education in attaining the objectives of this area of education. It may be of interest to note that the employers, who usually have been the most conservative in accepting the statements under study, show no disagreement and only five had no opinion.

59. *Vocational education should not encroach upon the activities of other agencies unless such agencies are not meeting the occupational needs which vocational education may effectively meet.*

This statement is the only negative statement in the sixty statements being studied. It asserts that there should be no encroachment upon the prerogatives of others unless these other agencies are not

TABLE 59

Employers of Kentucky area vocational school graduates. .	64	9	50	5	0	0

attaining their objectives. The thinking of some vocational educators might be that they would have competition from outside groups in the training field if they (educators) invaded the services areas of these outside groups. The question could be raised as to how sacred the rights of others are if the service needs to be rendered and is not being cared for. Table 60 shows how the respondents accepted the statement. In light of the number who had no opinion and the number who showed disagreement, the statement appears to have caused some consternation in the minds of the respondents. Those who disagreed with the statement are saying that vocational education should invade the prerogatives of other agencies, whether or not their objectives were being met; those who agree would not invade unless the other groups were not meeting the objectives which vocational education could meet.

Agreement by the state supervisors was less than for other subgroups but was still significant to the .04 level, and therefore the statement can be accepted as a principle as far as this group is concerned.

The thinking of this group may be influenced by the desire to get the job done regardless of others' prerogatives. All other subgroups, as well as the total group, agreed with the statement at a significance of less than the .01 level. Even though the agreement of the state supervisors was statistically less acceptable, the acceptance of all other subgroups and of the total group was such that the statement may be accepted as a general principle.

TABLE 60

Degree of Acceptance of Statement 59 by Total Group and Subgroups

Group	Number Responding	Response				
		Strongly Agree	Agree	No Opinion	Disagree	Strongly Disagree

60. *Vocational school personnel should work closely with labor and management, social services, philanthropic, governmental and other appropriate agencies.*

This statement correlates closely with statement 58. It varies in that vocational education may be expected to aid other agencies in attaining their objectives, whereas statement 58 implies that vocational education should use other groups to attain its goals. The cooperation of agencies seems to be more pronounced in recent years as attempts are made to alleviate substandard economic and social problems through increased employment. Table 61 shows how the panel accepted this statement.

There was complete agreement (except two "no opinions") among all respondents who were associated with vocational education. This apparent desire by vocational educators for the solution of mutual problems and for cooperation with agencies and groups to attain their objectives would appear to aid vocational education in attaining

its goals, both directly and indirectly—directly through screening, selection, and placement of its graduates, and indirectly through publicity and public relations.

Chapter III

A STRUCTURE FOR MEETING OCCUPATIONAL NEEDS BASED ON ACCEPTED PRINCIPLES

The purpose of this chapter is to propose a design for a local organization of vocational education which will adequately meet the occupational needs of youth and adults. A previous chapter points up considerations that must be given to this organization if it is to care for changing socio-economic conditions, varied occupational interests, and highly mobile populations. Apparently certain definite principles may be used in developing an effective structure. They are listed and briefly discussed in Chapter II. If these factors—changing conditions, occupational interests, scattered populations and definitely recognized principles—can be made to coincide in such a manner that the structure could be reasonably managed, then vocational education will have progressed with the times and society will have profited.

Public institutions are creations of the people to serve the people. They are efficient to the degree that services are provided in the most adequate and successful manner with the least expense. Boards of education have used this thinking in providing secondary schools that make available a greater number of services for more boys and girls. Generally they have been able to provide these enriched programs of education by eliminating smaller school units and incorporating them into larger, comprehensive schools.

Using this same philosophy, it seems reasonable to assume that the vocational education needs of people may be more efficiently served in a similar manner. By bringing more people together, program enrichment may be more efficiently attained. This enrichment should not be limited to caring fcr narrow occupational needs but should spread over the various vocational services. Parts of Chapter I have pointed out that the occupational needs of people are not limited to one-service areas. An institution designed to meet these needs must be comprehensive in nature, and, in most sections of Kentucky, it must provide services over a multi-county area in order to have sufficient school enrollment. It might be termed a *comprehensive .rea vocational school.*

This study does not propose to say how funds shall be provided or allocated, nor the action which might need to be taken to alter existing school legislation so that a different type of institution might be made possible. These things may be considered as problems for future research. However, as this proposal is viewed by the writer, few if any

changes in legislation would need to be made. Additional funds might be helpful.

It should be emphasized that the guidelines which are projected are not all-inclusive, but should be considered as basic. Many duties, responsibilities, and activities necessary to successful vocational school operation will need to be executed. Omission of reference to these necessary activities in this writing should not be considered by the reader as indicating that they are practices at which the researcher looks askance nor which he advocates discontinuing.

In an effort to place reasonable boundaries in projecting an efficient institution, the following aspects will be discussed: (1) administration, (2) supervision, (3) advisory services, (4) guidance and counseling, (5) course offerings, (6) in-school youth, (7) out-of-school youth and adults, (8) part-time and evening training, (9) public relations, (10) cooperating agencies, and (11) organization.

The accepted principles upon which the rationale for each of these aspects is based is listed in italics following the topic headings.

Administration

1. *The administrative head of an area-type school should be responsible to a higher administrative group.*
2. *The administrative head may delegate authority to his assistants commensurate with the responsibility he gives them.*
3. *The administration of the school should be kept close to the people.*
4. *The administration of vocational education will be efficient in proportion as it is elastic and fluid rather than rigid and standardized.*
5. *Only a person who has had considerable experience in at least one of the vocational fields should be appointed head of a comprehensive area vocational school.*
6. *At least one member of the State Department of Education representing vocational education should be included in any area group which may have administrative functions in an area vocational school program.*
7. *The genuine concern of people for vocational education will be in proportion to their understanding of its objectives and services.*
8. *The head administrator of a vocational school should be totally responsible for all activities in the institution.*
9. *Vocational education programs should be provided wherever there is a need to train youth and adults for jobs that exist.*
10. *Head administrators of comprehensive area vocational schools should have had special training in administration.*

The administrative head of an area-type school should be responsible to the people. It seems only natural that individuals have greater concern for those activities in which they have a part. One of the principles which was previously concurred with was, "People eventually make greater use of their schools where there is an orderly arrangement for citizen participation in planning."

The administrative head of an area-type school should be responsible to a higher administrative group. It is likely that the problems of finance and adequate facilities would be fewer if this administrative group were the State Board of Education. However, this board (through its representatives) should not administer without advice and consultation with a group selected from the area. Representatives from the State and area levels should work cooperatively for a strong program. Members of this total group would meet quarterly, or more often if conditions dictate, to discuss policy and make broad, over-all decisions (subject to State board approval) concerning the welfare of the school. They would act much in the capacity of a board of directors of a business enterprise, for indeed a comprehensive area vocational school would be a business enterprise.

The group should do much to aid in bringing about understanding of the objectives and services of vocational education. Genuine concern for this phase of education will be in proportion to these understandings. People cannot be expected to have a concern for something about which they do not know. It is felt that present understandings about vocational education leave much to be desired.

The operation of an area vocational school is a business. It does not produce a concrete commodity but its objective is no less certain. Persons who have responsibilities for administering this business, if they are to be successful, must follow good administrative practices. The time seems to have passed when administrators must perform petty office operations or sweep classrooms. Their working day, however long, must be used in administrative functions. The administrator should delegate responsibilities to his subordinates and, at the same time, give them the authority to carry out these responsibilities.

The administrator should guard against being victimized by standardization and rigidity. He must be continuously aware of changing occupational needs and permit his actions to be elastic and fluid in meeting these needs. The practices should be kept pliable by the use of the administrative advisory group. The State Board of Education should make advisory committee meetings required activities of the head administrator.

The head administrator should have total responsibility for all activities in his program of vocational education. He cannot delegate

away his responsibilities. This is not to say that he, personally, will perform all the duties that are to be performed. The good administrator will delegate and have an accounting from those to whom this delegation is made. His duties will consist of program interpretation, planning, organizing, staffing, directing, coordinating, reporting, and budgeting.

A person who occupies this position in the comprehenisve area vocational school should be one who has had considerable experience in at least one of the vocational services. He must be imbued with a sound philosophy of vocational education. He cannot lead a cause of which his understanding, sympathy, and vision are not a part. But experience in, and worthwhile philosophy about, vocational education are not in themselves sufficient for the administrator. He must have had special administrative preparation for this position. This training may be a period of time in which the individual may act as understudy to a competent administrator, or it may have been formal training in administration. One has little chance of successful administrating a comprehensive area vocational school if he knows nothing of recognized administrative procedures.

He should work cooperatively with the State supervisors of the various vocational education services as he initiates and carries on courses in agricultural, home economics, distributive, industrial, and business education.

Supervision

11. *Provision should be made for supervision of the instructional program of the school.*
12. *The function of supervision is concerned with program development and improvement.*
13. *Continued teacher development is a necessary part of program development.*
14. *Supervision is an accepted responsibility of school administration.*
15. *The competent worker, as a potential teacher, is not aware of the content of his occupation, nor is he generally able to develop courses of study from it.*

Provision should be made for supervision of the instructional program. Even though the head administrator has indirect responsibility for supervision, it is probable that he cannot include this task in his schedule of work. This job must be delegated to persons competent in supervision. They must be as concerned with the improvement of instruction as the head administrator is concerned with administration. It is likely that the supervision may fall to those who must perform

other duties. This person may be called a principal, assistant director, coordinator, or some other such title, but the responsibility for supervision must remain clear.

Teacher development is of particular concern for those new teachers who may not have had professional training. Many are not aware of the actual content of their occupations, nor are they generally able to develop courses of study. If there is a concern for program development, there must be a concern for continuous teacher growth. These two aspects are interdependent.

Occasions will probably arise when the principal or supervisor will need the aid of experts in particular fields. He should not assume a position of expertness in all areas, for indeed he will not be an expert in all areas. His function will be one of program development and improvement. The first step in bringing these things about may be the recognition of his own inadequacies and the request for help on special problems.

Advisory services

16. *Every vocational school administrator should make use of a formal administrative committee.*

    (Statement 17 was rejected by the panel.)

18. *Advisory committees should be used for each of the vocational course offerings.*
19. *The State Department should be more advisory than administrative in its actions within an area school.*
20. *People eventually make greater use of their schools where there is an orderly arrangement for citizens to participate in planning.*
21. *The adequacy and effectiveness of programs of vocational education are contingent upon the degree of citizen cooperation and participation in planning and evaluation.*
22. *A counselor must be concerned with aspects of the student that are outside his vocational education needs.*

Possessiveness must never become a characteristic of vocational school personnel. The tendency for school people to believe that schools were made for them seems to be all too prevalent. Vocational education cannot continue to exist if it does not meet the needs of people. The knowledge of these needs can be greater if persons for whom the school is designed can be brought in for advice and planning. Advisory committees should be mandatory, both on the administrative level (already discussed) and at the teaching level. For every different course that is offered in the comprehensive area vocational

school there should be a group with which the teacher and his superior may counsel so as to provide an efficient program of instruction. The types of persons composing these committees are already well known to vocational education personnel.

The old axiom, "Two heads are better than one" holds true in the use of these groups. It is necessary, however, that all members of all types of advisory committees know their duties and limitations in rendering their services.

It is possible that the administrator may think that advisory committee meetings consume too much of his time. But *this* is his job. He not only receives advice but he interprets programs to others in the same meetings. He explains his objectives, he answers questions, and he makes half truths whole. Possibly the major portion of the administrator's time should be spent in program interpretation.

Guidance and counseling

23. *In each school someone should coordinate all the various guidance activities and furnish leadership in improving guidance activities.*
24. *Effective vocational education for any profession, calling, trade, occupation, or job can only be given to the selected group of individuals who need it, want it, and are able to profit by it.*
25. *Vocational education will be effective in proportion to the degree that it enables each individual to utilize his interests, aptitudes, and intelligence to the highest possible degree.*
26. *The fact that a youth of the smaller community goes elsewhere to pursue an occupation should not deprive him of help in selecting it intelligently, of training for it, or of aid in securing employment in it.*
27. *In every community there are youths and adults out of school who need vocational guidance as much as or perhaps more than those still in school.*
28. *Class personnel should make tentative occupational choices on the basis of their interests, capacities, and requirements of the occupations.*

Every comprehensive area vocational school should have on its staff a person qualified in guidance and counseling.

His services should be available to youths and adults out of school as well as those in the area school. These persons need vocational guidance as much as those enrolled in courses in school.

Vocational education will be effective to the degree that it enables

each individual to capitalize on his interests, aptitudes, and intelligence. Usually the potential enrollee and school personnel must know what these attributes are if the student is to receive the optimum benefits from his enrollment.

In most small communities of Kentucky, youth have never had professional guidance services. When many reach employment age they tend to migrate to areas of employment opportunities only to encounter difficulties of a social as well as economic nature. The fact that a youth of the smaller community goes elsewhere to pursue an occupation should not deprive him of help in selecting it intelligently, of training for it, or of aid in securing employment in it.

Education, for any specific vocation, can be effective only for that selected group of individuals who need it, want it, and can profit by it. If these persons must be able to profit to an acceptable degree, there must be some means of determining who they are. They attempt to make vocational choices based on their capacities and requirements of the occupation. Most are unaware of their true capacities as well as requirements of the job. The discovery of this information would do much toward bringing success to the individual as well as make vocational education efficacious in its efforts to serve the person.

Course offerings

29. *Specialists should be held responsible for special areas of instruction.*
30. *Provision should be made in the area school to take care of the basic educational needs of people so that they may profit from the vocational training requiring those basic skills.*
31. *Vocational education will render efficient social service in proportion to how well it meets the specific training needs of any group at the time they need it and to the extent it is given in such a way that they can most effectively profit from the instruction.*
32. *For every occupation there is a minimum of productive ability which an individual must possess in order to secure (and retain) employment in that occupation. If vocational education is not carried to that point with the individual, it is not effective.*
33. *A school designed to meet the occupational needs of people should be so organized and conducted that it is able to admit capable applicants at any time class vacancies may exist.*
34. *Stress should be given to individual and small group instruction in teaching.*
35. *Courses in the area school should be justified on the basis of*

satisfying needs in this order: (1) *area needs*, (2) *state needs*, (3) *out-of-state needs.*

36. *Because of the increase in population, vocational education must make provision for increased services.*

Courses in the comprehensive area school should not be limited to satisfying the employment needs of its specific area. Because of the high mobility of people in Kentucky, specifically, and of labor, in general, it would seem be a waste of human resources to make such limitation. One of the prime purposes of vocational education is to meet the needs of industry, but a more important purpose is to meet the needs of *people* for industry.

Many will enroll in the comprehensive school who are deficient in education that is necessary for success in the occupations for which they wish to prepare. This education may be limited to reading, writing, or arithmetic, but may include physics, algebra, or trigonometry. These subjects are as necessary to the electronic technician as some of the basic subjects are to a less technical occupation. However, all such courses should be taught with the occupational objective in mind —they should not become major objectives. The inclusion of these courses may necessitate specialists in certain fields.

It is not visualized that the institution would award degrees or provide courses designed for transfer to institutions of higher learning. The courses should be terminal. The school should concern itself with meeting current occupational needs of people. It should consider its placement record as one of the principle criteria for its evaluation.

Flexibility is as necessary in course offerings and class management as it is in administration. All persons associated with vocational education should recognize that vocational classes are only for meeting the needs of people and not for administrative or teacher conveniences. Vocational education will render social service in proportion to how well it meets the needs of any group at the time they need it, and to the extent it is given in such a way that they can most effectively profit from it. This means that courses may open or close at any time during the day or year.

For courses of a continous nature, the school should be organized to accept enrollees at any time class vacancies may exist. This would apply particularly to those classes less technical in nature. The applicant for enrollment should not need to wait until a new semester begins before he is permitted to enroll. He should be allowed to proceed in his course as rapidly as his ability and initiative permits. The time for completion of the courses would thus vary according to the individuals' capabilities in achieving the objectives of the course and

not depend upon a definite time length. For every occupation there is a minimum of productive ability which a person must possess in order to secure and retain employment. If vocational education is not carried to that point with the individual, it is not effective. Setting time limits for enrollment does not assure this proficiency.

Intermittant enrollment will necessitate individual and small-group instruction. It will make real the theory of caring for individual differences and will allow the enrollee to begin training at the earliest possible time. The practice may cause some administrative and teacher problems, but it will likewise solve problems of the need for excessive equipment and of flooding the labor market with school graduates at regular intervals.

In-school youth

37. *Vocational classes for in-school youth should provide for promotion on a basis of performance.*
38. *All youth need to develop salable skills, understandings, and attitudes that make the worker an intelligent and productive participant in economic life.*
39. *The comprehensive area vocational school should function as a cooperative institution with high schools in the area and should not be a competitive institution.*

The comprehensive area vocational school should function as a cooperating institution with high schools in the area; it should not be a competitive institution. It should encourage high-school graduation for all youth. It should supplement their curriculums. Where vocational education classes are effectively provided in the high school, the area school should not provide duplicate facilities. However, in areas where single high schools cannot effectively provide facilities or enroll enough students, the area vocational school should make such provisions and enroll these in-school students for that particular part of the school day. The students' transportation would be provided by the local board of education to which the high school is responsible. Financing for these courses would be by contractual arrangement between the local boards involved and the administration board of the area school.

At present it would appear that no provision would need to be made for home-making classes for in-school youth. For high-school boys desiring vocational agriculture and for business and distributive education the need would exist in some places in the State. For those desiring vocational-industrial training the need would be extensive.

All youth need to develop salable skills and the understandings

and attitudes that make the worker a productive participant in economic life. This does not mean that the total high-school enrollment should be or become students in vocational education classes. It would seem that those responsible for formal guidance in both institutions might consider such philosophy as they work for the benefits of those to whom they render service.

Out-of-school youth and adults

40. *An institution which attempts to care for the occupational needs of out-of-school youth and adults should be organized so that it can receive applicants with a wide range of academic training.*
41. *Adults enroll in vocational courses because they know what they want and they expect to learn that which they want.*
42. *Adults are more likely to enroll in short-unit classes than in long-term courses.*
43. *The great mass of adult workers attending upgrading classes look to the vocational school for the technical rather than the manipulative side of their occupation.*
44. It is *increasingly difficult for the worker to keep up with what he must know and do in his work.*
45. *Because of technological developments the need for workers to be retrained will increase.*
46. *The occupational needs of workers are spread over many occupational areas. For example, the farmer has needs relative to mechanics and marketing; the industrial worker has needs relative to business education; the saleslady has needs related to home economics; etc.*
47. *In planning vocational education programs, we should be as concerned, perhaps more, about the needs of the individual as we are about the needs of his potential employer.*

The comprehensive area vocational school should service primarily out-of-school youth and adults. It should offer opportunities for training in a wide range of occupations. It should care for the occupational needs of the people with varied academic background. Kentucky people have such backgrounds. It should not hesitate to offer courses in the more menial occupations or those of a more exotic nature, if such courses are needed.

The training needs of workers are spread over many occupational areas. For example, the farmer has needs in mechanics and marketing, as well as in soils and crop and animal production; the industrial worker has needs in business education; and the saleslady has needs in

home economics. The projected area school should be efficient in caring for the total needs. The crossing of the vocational service lines should be no problem in meeting these needs. The school should serve the total vocational needs of people, not just the industrial need, or agricultural need, or home economics need. Indeed, the institution should be associated with no particular service, but with vocational education. A farmer may be enrolled in an upgrading-type class in welding; an auto mechanic student may be enrolled in a course in bookkeeping; part of a distributive education student's curriculum may consist of a course in interior decoration.

In planning programs for the student, the individual's needs should be of as much concern as the needs of his potential employer. Surely, he should be capable of performing the skills expected of him, but his attitudes about the job, organized labor, management, democracy, honesty, diligence, cleanliness, regard for his fellow man, and a host of other things will cause him to succeed or fail in his endeavors. His pursuits in the area school should provide for development of attitudes.

Adults enroll in vocational courses because they know what they want and they expect to learn that which they want. They are usually more certain in their objectives than are in-school youth. Because of more responsibilities, they usually are in a greater hurry to complete courses of training. Many will hesitate to obligate themselves for long periods of training—not because they are not cognizant of its value but because of pressing responsibilities. To the extent possible, the comprehensive area vocational school should organize its courses on a short-unit basis. Instead of one course of 1,000 hours, the course likely can be divided into shorter units, the total of which would equate the over-all course.

It is increasingly difficult for the worker to keep up in what he must know and do in his work—mostly with what he must know. This should have implications for persons whose responsibility it is for organizing upgrading types of classes. They should, generally, be classes involving the technical or informational rather than the manipulative phases of the occupation.

Because of technological development, the need for workers to be retrained will increase. The working years of some craftsmen will be greatly diminished because the craft itself will disappear. This retraining activity will need to occur at the convenience of the worker—most likely at night. The night program for preparatory training in the comprehensive area vocational school should be as extensive as the day program. As the nature of retraining is preparatory, it seems that few if any problems would be met in also enrolling potential threshold workers in courses designed for displaced workers.

Part-time and evening training

48. *Vocational education should continue to provide related instruction to apprentices.*
49. *If a vocational education program is meeting the occupational needs of people within its assigned geographical area, its evening class enrollment should exceed its in-school enrollment.*
50. *Vocational education is needed to supplement apprenticeship.*
55. *Vocational education activities may be carried on adequately in locations outside the vocational school center.*
56. *Generally, people who would not travel 25 to 30 miles to attend class would attend the same class if it were held in their immediate community.*
57. *Probably all communities have individuals who are interested in the promotion of vocational education activities of a given kind in that particular community.*

Enrollment in courses for up-grading workers (including homemakers) should exceed preparatory enrollments. The projected school should be responsible for providing the evening classes which are not otherwise provided throughout its assigned multi-county area. This should include all vocational service areas. Coordinators from the comprehensive school should work closely with vocational teachers associated with high schools in the area in determining course needs and promotion and obtaining instructors for such classes.

Vocational education activities may be carried on adequately outside the vocational school center. Many people who would not, or could not, travel 25 to 30 miles to attend an evening class would attend the same class if it were held in their immediate community.

Coordinators should make special efforts to provide related instruction for apprentices in the remote locations in the area. As the Bureau of Apprenticeship has looked particularly to vocational education for this instruction, provision of instructional material through itinerant visitation may be necessary.

Others from whom coordinators may receive assistance in away-from-school programs are those particularly concerned individuals who seem to reside in all communities and who are interested in the promotion of vocational education activities of a particular type. These persons are usually associated with organized labor, management, farm, sales, or homemaking groups.

Public relations

51. *The public will take advantage of vocational education services in proportion to the knowledge it has about those services.*

52. *Understanding on the part of people is vital to the continued financial support of vocational education on the local, state, and national levels.*
53. *Community understanding is vital to teacher morale and to permanence and creativity in the profession.*
54. *Interpreting the vocational school function to citizens of the area is one of the primary responsibilities of the head administrator of the school.*

The public will take advantage of vocational education services in proportion to the knowledge it has of those services. People cannot act on something with which they are not familiar. This being true, it would seem that no effort should be spared in interpreting the philosophy, objectives, and actions of vocational education in general and the area school in particular. This understanding is vital to the continued financial support and use of the school.

Of all the elements that make a sound program of education, probably the most important is good teachers. Instructors in the vocational school must be competent in what they teach and proficient in method in teaching it. The school must attract capable people. To do this, it must have an image that will bring about this attraction. The community must perceive the school as a desirable institution with which a person would desire to be associated. This perception is vital to the morale of the teachers already associated with the school. The high retention of good instructors is probably closely correlated with a desirable school image.

The task of interpreting the functions of the vocational school to citizens of the area should be one of the primary responsibilities of the head administrator. Even though some delegation of this duty may be in order, he should accept the larger portion of this responsibility as his obligation.

Cooperating agencies

58. *Vocational education should use the services of other agencies in attaining its objectives.*
59. *Vocational education should not encroach upon the activities of other agencies unless such agencies are not meeting the occupational needs which vocational education may effectively meet.*
60. *Vocational school personnel should work closely with labor, management, social services, philanthropic, governmental and other appropriate agencies.*

Personnel in vocational education should work closely with other agencies in attaining the objectives of vocational education. Many of

these groups have much to offer, and it seems only reasonable that such organizations be used if the over-all program can be efficiently implemented. The head administrator should use discretion in working with these groups lest he tend to encroach upon others' "domains" or prerogatives. However, if such other agencies are inactive or ineffective in meeting those occupational needs which vocational education may effectively meet, consideration should be given to implementing these needs.

Organization

It is believed that the basic guidelines have been presented by which an efficient program of vocational education can best be provided at the local level. They have not been drawn in detail; such minuteness seems to be unnecessary. In order that the reader may have a clearer concept of the proposed organization, Figure 1 shows an organization chart which reveals various positions and their relationships. This structure implements the principles of vocational education which the panel of experts agreed to be sound. It will also provide a means of meeting the more heterogeneous training needs of workers engaged in a rapidly changing society.

Some Advantages of the Institution

The comprehensive area vocational school offers some unique advantages. The enrichment in program whereby students would be instructed in courses directly related to their principal occupational courses was mentioned in the introductory statements of this chapter. However, it seems that aspects of this enrichment should be pointed out more specifically. Some examples would be providing welding in an adequately equipped welding shop for persons enrolled in agriculture courses (in-school students, young or adult farmers), and courses in sales training (distributive education) and bookkeeping (business education) for students enrolled in curriculums of an industrial nature, who may in time manage their own businesses. Examples would be numerous where program enrichment would more adequately meet the occupational training needs of people.

The projected school would make available services which could not be provided otherwise. This would be true for both in-school and out-of-school students. Courses which could not be justified in a local high school because of lack of funds or enough students could be provided in the area school by enrolling students from two or more surrounding high schools, thereby enabling the operation of a justifiable course.

Fig. 1.—Organization Chart for A Comprehensive Area Vocational School.

More technical courses for out-of-school youth and adults may better be made available to persons in a larger area than in a small locality. This is particularly true of those sections of the State which are not metropolitan. For example, it would probably be impractical, perhaps impossible, to provide adequate facilities for a course for teaching electronic technicians on a single county or small-area basis. The cost would be too great, and capable enrollees too few.

Specialists in various fields would be available because of sufficient class enrollments provided from the larger geographical area. For example, in agriculture, specialists in weed control, livestock feeding, artificial insemination, crop diseases, or livestock diseases could be had. In home economics, specialists in interior decoration, nutrition, or child care may be provided.

Greater opportunities may be provided for adequate supervision and in-service training of teachers. The ease and probable efficiency of those activities would, to a large degree, depend on the teachers' proximity to each other. Teachers have many problems. It has been found that many of these difficulties can be alleviated through the aid which itinerant teacher educators may provide while they are engaged in their teaching. This "over the shoulder" aid may also be supplemented by extension classes designed for upgrading the teacher. Prosser and Quigley describe the affort in this way:

> The most successful teacher training for vocational teachers in the day schools has unquestionably been secured by the extension method and the use of the itinerant teacher trainer. Traveling from one community to another he gives training after working hours to prospective teachers already occupationally competent and to those already employed as novices in the teaching service of vocational schools.[1]

Greater efficency in initiating upgrading-type classes for all workers may be obtained by coordinators working from the area school than by the teachers who have full-time teaching responsibilities at local high schools. Cooperation of the local teacher and the coordinator should be instrumental in increasing enrollment many-fold in adult classes of agriculture, business education, distributive education, home economics, and industrial education. Persons who are particularly proficient in certain subjects may be engaged to teach evening classes in locations outside their own immediate environs. Coordinated efforts guided by a single administrative unit in a multi-county area would do much to alleviate the occupational training needs of workers in that area.

Vocational guidance for out-of-school youth and adults would provide a service not now provided by any other type of school. The need for this service is not diminished by the fact that these people are not formally associated with school activities. Their needs are probably greater.

---

[1] Prosser and Quigley, *op. cit.*, pp. 308-309.

specialties are to be needed—or not needed—in our free (which means *unplanned*) society a decade or so from now, we could really get down to the fine points of producing an educational program to support the highly efficient technology we can in general terms see as an emerging possibility. The problem is just that simple.

Another solution, of course, would be to *assign* particular specialties to particular human beings, then assign matching quotas of jobs to produce the matching quotas of goods to satisfy the necessarily matched taste quotas of society. Too many individuals, however, object to such definite quota assignments.

The viewpoint proposed here, and supported in the study reported here, is that *general* and *vocational* education should be of the same piece of cloth, that we have a try at educating people who have at least a modicum (and we should work for more) of both the far and the close perspectives, who have a specialty but see it in relation to the broad needs of society, and who realize that change is inevitable and that shifts in specialty are the rule and not the exception. In other words, people in vocational education are arguing that all education is "vocational," and vice versa. Some of us hold that such talk makes a lot of sense.

And if it does—well, the time has come to be rid of the dichotomy of *general* versus *vocational* education. The time is for both general and vocational education to be done better, both of them!—or, better still, for them to be regarded as *one* and done better!

Vermilion County, Illinois,

Technician need in this study includes determination of the need for technicians of Vermilion County industries and the qualifications the technicians must have to meet the demands of the industries. There were 262 firms within the county that were potential employers of technicians, and 80 of them employed 512 technicians. An interview form was used to gather information from 80 employers. Of the 512 technicians contacted, 344 returned questionnaires. The findings disclosed that employers were interested in both a local supply of trained technicians and an opportunity for employed technicians to improve their educational qualifications. The majority were operating some sort of training programs and were hiring technicians who had been trained outside the county. The mean salary of technicians who had attended high schools outside Vermilion County was $907 higher than of those who had attended high schools within the county. To meet demands for new personnel between 1963 and 1968 it would be necessary for a technical school to have enrollments of 100-120 in mechanical, 50-60 in electrical-electronic, and 30-40 in chemical technology. Comparison of employers and technicians responses showed -- (1) Both groups felt mathematics, English, and speech were very important to the technicians, and (2) Technicians considered themselves adequate in these subjects, while employers felt they were inadequate. May 1964
Under terms of Title VIII, National Defense Education Act

FOREWORD

On February 1, 1963, this project was undertaken by the College of Enineering of the University of Illinois, Danville Unit School District #118, and the Illinois State Board of Vocational Education and Rehabilitation. Funds were supplied by all three in joint sponsorship under the terms of Title VIII of the National Defense Education Act of 1958. The project was executed by the Department of General Engineering and Danville Unit School District #118.

Since 1959, I have been Chairman of the Engineering Technology Curriculum Advisory Committee of the College of Engineering, which has been working in cooperation with the Technical Education Service of the Illinois Board of Vocational Education. The primary responsibility of the committee is to provide guidance and leadership in the development of strong educational programs in Engineering Technology. The cooperative effort of both groups has resulted in the establishment of a number of high level programs in Engineering Technology throughout the State of Illinois. However, much work remains ahead to fully satisfy the educational needs in this type of education.

One important aspect of any educational system is research, and research in technical education within this State has not been extensive. This study is an initial effort in the development of such research. It is intended that there will be subsequent studies of similar nature, and that the net effect will be a firm basis of facutal information which will assist in the development of technical education within the State of Illinois.

Jerry S. Dobrovolny
Professor and Head

Chapter 1

INTRODUCTION

The objectives of this study are closely associated with the title. The term "technician need" has several interpretations, and for the purpose of this study this title was interpreted in two different ways. The first interpretation was that of the needs of Vermilion County industries for technicians; the second interpretation was that of the needs of the technicians to meet the demands of the industries in Vermilion County. Objectives of this study are listed below:

OBJECTIVES

I. To determine for Vermilion County:
   A. The number of practicing technicians in the various technologies.
   B. Specific functions of (or demands upon) technicians in this County.
   C. The present educational qualifications of technicians.
   D. The educational qualifications of technicians as desired by:
      1. Themselves
      2. Their employers
   E. The potential student enrollment for programs in various engineering technologies.

II. To organize and develop the above information in a manner which will lend itself to curriculum development.

III. To discover more efficient techniques for making studies of this kind.

THE NATURE OF THE STUDY

The geographic limitations of this study were the boundaries of Vermilion County. The basic design was directed toward future use of information developed by this study in curriculum development within the County; however, the design was also set up to develop a pattern for future research efforts in technical education. A number of unstructured responses were included in the instruments used for this study with view toward future alteration and refinement of these instruments. Staff

members described this entire project as a pilot study in technical education during their interviews with employing firms and employed technicians, and continually asked for criticisms on procedures and techniques.

Statistical inference from a sample was not used in this particular study; this was a saturation study of technicians and of firms which employed technicians within this County, and the descriptive information contained in this report is parametric information for Vermilion County. Wherever necessary, statistical terms which appear are explained, and familiarity with statistics is therefore not a necessity for understanding this report.

During execution of the study, interviewers were consistently asked the same question, and this question concerned the use to be made in Vermilion County of information and recommendations developed by this study. This question could not be answered by staff members, and cannot be answered by this report.

"Curriculum planning is a political process, just as it is an ideological process of determining ends and means for education. Proposals must find their way successfully through the political structure into educational institutions or slip into obscurity."[1]

The report of a study such as this can only present information and recommendations relating to the nature and extent of a certain educational need. Decisions relating to the solution of any educational problem in Vermilion County remain where they have always been—in the hands of the citizens of Vermilion County.

GENERAL NEED FOR TECHNICIANS

The need for technicians is a problem of national proportions. The fastest growing of all occupational groups during the decade from 1950 to 1960 was the professional and technical group. This trend of growth is expected to continue at an accelerated rate: by 1970 projected figures show a 43% increase in this occupational group, and by 1975 a 65% increase. Within this group the fastest growing has been the technicians. Rates of increase in certain areas of technical work have been reported at a phenomenal figure of more than 600%. The underlying cause of this high rate of increase is the rapid change of the social order in the United States to a society dependent upon science and technology.[2] Such a society needs—indeed demands—of its members an ever increasing amount of technical and scientific knowledge.

Within the State of Illinois, the demand for technicians with post high school training in fields of technology associated with

engineering far exceeds the supply. Accurate totals of the numbers of such technicians being trained by both public and private institutions within Illinois are not available, but estimates based upon published reports place the estimated enrollment at between 6,000 and 9,000, with a maximum (and seldom achieved) number of graduates at between 2,000 and 3,000. Similar estimates of demand are that, by 1965, various industries within Illinois will need more than 15,000 graduate technicians per year.[3]

One major reason for the low ratio of graduation to enrollment has been this extreme demand. Students at technical schools frequently have several attractive job offers before they finish their training, and they often find that the attraction of a job offer exceeds their desire to graduate.

Many large firms have a regular schedule of recruiting visits to institutions of higher education, including technical schools, for the purpose of hiring graduates, and they make these visits to hire highly trained graduates even during times when they are engaged in production cutbacks and major layoffs. It is unpleasant, but true, that scientific and technical advances have already inflicted unemployment and consequent hardship upon people whose talents and skills were in steady and heavy demand in the past. The immediate future holds grim prospects for people who are unable (or who do not have an opportunity) to acquire the additional training demanded by this new order of society.[4]

Chapter 2

IDENTIFICATION OF THE TECHNICIAN

The word "technician" is often used as a generic term to describe a wide range of occupations. Even when used with restriction to the field of engineering, as it is in this study, this term still covers a wide range of job functions. The semantic confusion which surrounds this term is further compounded by the fact that engineering itself covers a wide range of functions in industry, by the fact that engineering is often described as "technical" work, by the fact that technicians are often called engineers, by the fact that some technicians acquire additional training and qualify as engineers, and by the fact that engineers sometimes do the work of a technician. It is quite possible that the current shortage of engineers is only an apparent shortage, that many engineers work as technicians because technicians are not available, and that the real shortage exists in the ranks of the technicians.

Figure I shows a breakdown of the engineering manpower team into engineers, technicians, and craftsmen. In his proper place the technician works in the field between engineering and craftsmanship, and this is a wide field. A technician is not an engineer and he is not a craftsman. He has neither the advanced scientific training of the engineer nor the high level skills of the craftsman. He has, instead, his own peculiar skills which lie in the general area of the application of scientific knowledge to workable and practical reality. For instance: investigation of a problem may lead an engineer to a conclusion or a theoretical solution for the problem; it is the function of a technician to test this theoretical solution, to suggest practical changes, and when possible, to transform this theoretical solution into reality. In doing this he must work with the engineer and with the craftsman. He must therefore be familiar with both engineering and craftmanship, and he must know enough about each to discover how they can be used together in order to create a workable solution to the problem. Engineers are not trained to be technicians. The scientifically oriented engineering graduate of today needs the help of highly trained and competent technicians in order to perform his part of the vast amount of work to be done by the engineering manpower team.

Figure I

The following is material on technicians taken from other sources:

DEFINITIONS

"In general, the engineering technician is a person whose chief interests and activities lie in the direction of the testing and development, the application, and the operation of engineering and scientific equipment and processes. Classified on the basis of educational certification, the engineering technician would be a graduate of a technical institute type of curriculum as accredited by the Engineers' Council for Professional Development, or recognized equivalent. Classified occupationally, the engineering technician performs semiprofessional functions of an engineering or scientific nature, largely upon his own initiative and under only general supervision of a professional

engineer or scientist; he assists the engineer or scientist and supplements his work.

"Typical among the wide array of semiprofessional functions performed by engineering and scientific technicians are: drafting, design, and development of products and of engineering plant; installing and operating equipment; estimating costs; selling; and advising customers on the use of engineering or scientific equipment.

"In many instances, the technician may serve as a liaison between the engineer or scientist, on the one hand, and the skilled craftsman or layman on the other hand. In carrying out these various activities, he may have group leadership responsibilities. Therefore, the technician must be able to communicate mathematically, scientifically, and linguistically."[5]

"Engineering technology is that part of the engineering field which requires the application of scientific and engineering knowledge and methods combined with technical skills in support of engineering activities; it lies in the occupational area between the craftsman and the engineer at the end of the area closest to the engineer.

"An engineering technician is one whose education and experience qualify him to work in the field of engineering technology. He differs from a craftsman in his knowledge of scientific and engineering theory and methods and from an engineer in his more specialized background and in his use of technical skills in support of engineering activities.

"An engineering technology curriculum is a planned sequence of college-level courses, usually leading to an associate degree, designed to prepare students to work in the field of engineering technology."[6]

CRITERIA FOR IDENTIFICATION

"The individual in the occupation:

1. Applies knowledge of science and mathematics extensively in rendering direct technical assistance to scientists or engineers engaged in scientific research and experimentation.
2. Designs, develops, or plans modifications of new products and processes under the supervision of "professionals".
3. Plans and inspects the installation of complex equipment and control systems.
4. Advises regarding the maintenance and repair of complex equipment with extensive control systems.

5. Plans production as a member of the management unit responsible for efficient use of manpower, materials, and machines.
6. Advises, plans, and estimates costs as a field representative of a manufacturer or distributor of technical equipment and/or products.
7. Is responsible for performance or environmental tests of mechanical, hydraulic, pneumatic, electrical, or electronic components or systems and the preparation of appropriate technical reports covering the tests.
8. Prepares or interprets blueprints and engineering drawings and sketches.
9. Selects, compiles, and uses technical information from references such as technical handbooks, manuals, and digests of research findings.
10. Analyzes and interprets information obtained from precision measuring and recording instruments and makes evaluations upon which technical decisions are based.
11. Analyzes and diagnoses technical problems that involve independent decisions.
12. Deals with a variety of technical problems involving many factors and variables which require an understanding of several technical fields.

"The criteria are not to be given equal weight in identifying "technicians", and it would not be necessary for a position to require all the competencies implied to be classified as technical.

"The technician must be familiar with the work of the professionals and the craftsman in his area of proficiency, since he may work with professionals at some stages and with craftsmen at others."[7]

GENERAL ABILITIES

"1. Facility with mathematics; ability to use algebra and trigonometry as tools in the development of ideas that make use of scientific and engineering principles; and understanding of, though not necessarily facility with, higher mathematics through analytical geometry, calculus, and differential equations, according to the requirements of technology.
2. Proficiency in the application of physical science principles, including the basic concepts and laws of physics and chemistry that are pertinent to the individual's field of technology.

3. An understanding of the materials and processes commonly used in the technology.
4. An extensive knowledge of a field of specialization with an understanding of the engineering and scientific activities that distinguish the technology of the field. The degree of competency and the depth of understanding should be sufficient to enable the individual to do such work as detail design using established design procedures.
5. Communication skills that include the ability to interpret, analyze, and transmit facts and ideas graphically, orally, and in writing."[7]

TECHNICAL OCCUPATIONS IN RESEARCH, DESIGN, AND DEVELOPMENT

"For the purposes of this project, the Research, Design, and Development Technician is characterized as follows: He works in direct support of engineers and physical scientists, performing tasks which are functional parts of scientific and engineering activities requiring practical application of fundamental theory. The range of activities varies in complexity and is usually in a specialized area of research, design, or development. He usually is concerned with analysis and employs creative skills, and occasionally requires certain manipulative skills. The "technician" as designated herein requires less than the four or more years of college training required of the graduate engineer or scientist.

Sources of Research, Design, and Development Technicians

"The sources of such technicians include workers who can move from related jobs, applicants who complete technical courses for these terminal occupations, and students who qualify at an intermediate stage of advanced education. These technicians usually qualify through special programs of colleges, universities, junior colleges, technical institutes, recognized apprenticeship and journeyman skill improvement programs, vocational schools, in-plant training, and armed forces training. Some of these technician jobs are filled by college students of science and engineering who work part time or leave college prior to graduation; others are filled by skilled craftsmen who have acquired the necessary knowledge of mathematics and science, e.g., through apprenticeship or journeyman programs.

"The Technical Institute

The technical institute primarily provides post-secondary

education. The courses range from 1 to 3 years—usually 2—and usually prepare students for broad categories of technical work rather than for specific jobs. The training combines the practical application of certain engineering and scientific principles to technical problems with the development of manipulative skills needed in drafting and laboratory work. In general, the student receives intensive technical training but less theoretical and general education than is provided by 4-year engineering and liberal arts colleges. Such programs provide certain basic education for entry jobs in these fields in support of engineers and scientific personnel or for entrance into apprenticeship programs with the possibility of advanced standing. In most cases, further training is necessary in the specific jobs these workers are to perform.

"Training by Industry

Industry provides two general types of training programs for research, design, and development technicians; a well-planned, formalized program such as apprenticeship for inexperienced youth which prepares them for specific occupations, and supplementary training designed to make the fullest possible use of qualified technicians' skills and abilities.

Each formalized training program consists of two integrated segments. A portion of the training is of the "on-the-job" variety on a rotation basis to develop an understanding of the job functions and environment. The instruction in the mathematics, science, and fundamental technology related to the field of specialization usually is conducted at or in cooperation with nearby educational facilities.

Supplementary training is used to prepare the technical staff for specific work assignments, to introduce new scientific developments, to develop skills that are in short supply, and for advancement to higher grades."[8]

THE SPECIALIZED NATURE OF THE TECHNICIAN

The preceding was a general identification of a technician and of the area within which he works. The generalities included therein are not meant to imply that a technician is an all around expert at everything. The technician is necessarily a specialist. The time limitations of the proposed two-year post high school curriculum effectively prevent him from delving into a variety of the many different fields of technology.

The following definition, plus material concerning essential characteristics and curriculum for technical education, was developed by the Engineering Technology Curriculum Advisory

Committee of the University of Illinois. Examination of this example will reveal that it is a higly specialized curriculum.

An Example: The Engineering Technologist in Machine Design

Definition:

An individual who has the desire, the interest, the knowledge, and the sociological awareness to take skeletonized plans and transform them into producible components and systems that satisfy a known need both functionally and economically

Essential Characteristics of an Engineering Design Technologist

Fundamental science and engineering knowledge
Effectiveness in communications
Awareness of indutrial materials and practices
Appreciation of human relations
Skill in the solution of engineering problems
Interrelationships of design and economic factors

Education Requirements for Development of Essential Characteristics

A. Science and Mathematics

Mathematics - algebra, trigonometry, applied analytical geometry and calculus
Physics - mechanics, heat, electricity
Chemistry - chemistry of the materials of engineering

B. Communications

Verbal - rhetoric, composition, technical report writing, oral
Graphic - sketching, theory of projections, descriptive geometry, dimensioning, tolerance, sections, assemblies, charts, and graphs

C. Specialized Technology

Statics, dynamics and strength of materials
Manufacturing processes and machines
Materials (their alloys and heat treatment)
Mechanisms and design of machine elements
Electric and hydraulic controls
Machine design projects

D. Sociological

American institutions (sociological, economic, governmental)
Psychology and human relations
Economics of industry
Industrial organization and operation

SUGGESTED TWO YEAR MACHINE DESIGN TECHNOLOGY CURRICULUM

Course	Hours			
	Class	Laboratory	Credit	Contact

Industrial Organization and Operation	3	0	3	3
Psychology and Human Relations	3	0	3	3
	14	13	18	27

Curriculum designs for other technologies would look quite different from the preceding design. Each curriculum would be just as highly specialized-but specialized in a different direction.

The courses listed in the preceding Machine Design Curriculum are all post-high school college level courses. It is not possible to educate technicians by merely renaming the courses which students regularly take in high school. Successful technical education is at the post-high school level and the courses given in such a school will pose definite intellectual demands upon the students. The academic demands upon a student enrolled in an engineering technology curriculum are quite similar to the academic demands upon a student enrolled in a 4-year college. It is necessary for a student to be mentally and psychologically capable of two years of hard work in order for him to master the curriculum of a good post-high school technical school.

Chapter 3

DESCRIPTION OF VERMILION COUNTY

GENERAL

Vermilion County includes an area of 898 square miles with dimensions roughly 44 miles long by 22 miles wide. The population in this County totaled 96,176 according to the last census (1960) with an urban concentration of 41,856 in its largest town, Danville.

The County population increased 10.4% during the decade from 1950 to 1960. The population of Vermilion County did not increase at the same rate as the entire State of Illinois. The state population increased 15.7% during this decade. One way, however, in which Vermilion County exceeded the average for the State of Illinois was in the percent of its population under 18 years of age. In 1960, 34.8% of the Vermilion County population was under 18 years of age, while throughout Illinois this figure was a slightly lower 34.1%.[9] Projections using census figure trends, retail sales volumes and the known school population in the County arrive at a present (1963) estimate of population in Vermilion County slightly in excess of 100,000.

INDUSTRIAL

This County is definitely industrial in nature. It contains 143 manufacturing establishments of sufficient stature to be included in the 1963 Illinois Manufacturers Directory, and 19 of these plants were operated by various firms among the 1,000 largest industrial corporations in the United States.[10] Vermilion County contained .81% of the total of the 17,609 manufacturing establishments listed for the state. This fractional percentage might tend to mislead unless this County is compared to other counties in Illinois. Vermilion County was exceeded in the number of manufacturing plants listed by only 14 of the 102 counties in Illinois. In percent increase of new plants listed, however, this County was in 1963 falling behind the state; the rate of increase for Vermilion County was 5.1%; for the entire state, the rate of increase was 7.9%.[11]

During the first quarter of 1963, 799 Vermilion County businesses of all kinds were employing 4 or more people. This was

.86% of such businesses in Illinois. Comparisons with state totals of number of people employed and total wages paid show that Vermilion County's .86% of such businesses accounted for .75% of the people employed in Illinois by such businesses and for .68% of the wages paid by such establishments in Illinois. It is not the purpose of this report to assess general employment and wage rates in Vermilion County, but the figures for this quarter suggest a possibility of the presence in this County of a considerable number of smaller-than-average businesses paying lower-than-average wages.

When considering any grand totals such as those above for the State of Illinois, however, one must always remember the overpowering influence of the Chicago area. For instance, Cook County alone accounted for 11,339 of the 17,609 manufacturing establishments listed in the Illinois Manufacturers Directory. Excluding the 12 counties in the Northeast Section of Illinois, Vermilion County contained 3.4% of the manufacturing plants in the remainder of the state and was exceeded in number of manufacturing plants by only 7 of the remaining 90 counties in Illinois.

MEDIAN AND AVERAGE INCOMES: FINANCIAL COMPARISONS

Another way to assess general income in this County is to consider the median (or midpoint) of incomes. The median income for 1962 of households in Vermilion County was approximately $4,770, while for the entire state the median income per household was approximately $5,780. Stated in another way, this means that one half the households in the state had an income of less than $5,780, while one half the households in Vermilion County had an income of less than $4,770. The effective buying income of Vermilion County, however, was a relatively high average of $6,135 per household. This average was exceeded by only 29 counties in the state, including those in the Chicago area. This high average, together with the fact that there was a higher percentage of per household incomes in the $0 to $4,000 range and a lower percentage in the $6,000 to $10,000 range in Vermilion County than in the entire state, indicates a general pattern of income distribution. In this County, as compared to the entire state, larger numbers were in the lower income range, approximately the same numbers were in the middle range, fewer were in the range immediately above the middle, and a relatively very few had very high incomes. The City of Danville showed similar income distribution except that there were approximately 4% less households in the lower income range and approximately the same number more in the

higher income range. The median income for Danville households in 1962 was approximately $5,020 and the average effective buying income was $6,607.[12] The fact that the Danville average was farther above the Danville median than the County average was above the County median suggests that many of the very high incomes may be located in the Danville area.

EDUCATIONAL SYSTEM

Vermilion County's public educational system was, in 1963, made up of 44 school districts, two of which were unit school districts. The remaining 42 districts were separate elementary and secondary districts which overlapped each other throughout the entire county. Consolidation of school districts was in progress. Since 1957, eight school districts had been consolidated with districts among the 44 existing in 1963, and plans were for this consolidation to continue. Boundaries of the peripheral school districts of the County did not always follow the County lines, but the overall effect upon the County was negligible.

Total 1963 enrollment in all the schools in the County was approximately 20,000 of which approximately one half were enrolled in the County's largest district, Unit District 118 in Danville. Unit Distict 118 also operated Danville Junior College offering two-year post-high school curricula and, through its Division of Applied Sciences, a two-year curriculum in Electronic Data Processing and courses in Mechanical Technology. In 1953 the ratio of high school students to elementary students in Vermilion County was 1/3.12; by 1963 this ratio had increased to 1/2.50, indicating a larger proportion of students continuing into and through secondary education. Enrollment figures for 1964 showed 1,160 high school seniors and 1,600 juniors in attendance at various schools in this County.[13]

Cost and Valuation Comparisons

School costs were increasing throughout Illinois, and Vermilion County was no exception except in its lower rate of increase. Figures II, III, IV, and V show the rate of increase in school operating cost per student and also assessed valuation for Vermilion County and for the State of Illinois.[14] Where cost per pupil appears, it is shown in terms of total operating costs per pupil. Real total cost would in both cases be greater because operating cost is the total expense of operating an existing school; it does not include debt retirement, new equipment, new buildings or new grounds.

TRENDS IN ASSESSED VALUATION AND OPERATING COST PER STUDENT IN VERMILION COUNTY AND IN THE STATE OF ILLINOIS

1958-59
1959-60
1960-61
1961-62
1962-63
1963-64

Equalized assessed valuation is shown for the state to indicate a trend for comparison with operating cost per pupil. True, rather than equalized assessed valuation is shown for Vermilion County because equalized assessment gives values which include repetitive use of assessment values in taxation by overlying school districts, and this tends to give false impressions about the true total assessed value of all taxable property. Figures II, III, IV, and V are drawn on identical scales to afford comparisons of trends. It is evident from these figures that the rate of change in assessed valuation for the state was similar to the rate of change in cost per student. It is also evident that this was not true in Vermilion County.

In 1957 the assessed valuation of Danville Unit District 118 was $123,977,084, which was 41% of the assessed valuation of Vermilion County. In 1962, Unit District 118 was assessed at a lower figure of $123,051,288, which was 40% of the assessed valuation of the County. This school district contained (in the City of Danville alone) 43% of the population, 49% of the effective buying power, 50% of the total income, and most of the industry.[15] It is a distinct paradox in Vermilion County that Danville Unit District 118 had an assessed valuation of only 40% of the assessed valuation of the County.

School Population Projections

If the overall rate of growth in Vermilion County maintains the average rate it has displayed through the past decade, the approximate total school population in the County will be:

1964-65 ----- 20,300
1965-66 ----- 20,600
1966-67 ----- 21,000
1967-68 ----- 21,400
1968-69 ----- 21,700
1969-70 ----- 22,000

These projections are based upon the assumption of uniform rate of increase. If economic development and a consequent increase in population proceed at an accelerated rate in Vermilion County, the school population will exceed these projections.

Chapter 4

CONDUCT OF THE STUDY

UNIVERSE OF THE STUDY

The first task of the research staff in the conduct of this study was to identify the universe of industries in Vermilion County. Listings of industries were not well developed and available listings had never been consolidated into a master list. Industry listings were gathered from all available sources. Sources of these listings included the Danville Engineers Club, industrial customers of the banks in this County, industrial customers of the public utilities in this area, the Danville Chamber of Commerce, governmental units within Vermilion County, the Vermilion County Clerk's Index to Business Registration, the Vermilion County Credit Bureau, the Illinois State Employment Service, and searches of the city directories and telephone directories. After the elimination of financial, medical and school installations plus many retail installations, there remained a master list of more than 1,000 business and governmental installations which could possibly employ technicians. Caution was exercised, however, in eliminating retail establishments because of the possibility that they might employ technical sales representatives.

SELECTION OF WORKING LISTS

With the identification of the universe in hand, selection proceeded toward the working list of possible employers of technicians. Both of the research staff members from Unit School District 118 in Danville were well acquainted locally and their close acquaintance with industry in Vermilion County allowed the elimination of many business installations on the master list without the necessity of personal contact. Wherever doubt existed, each of these installations was either included in the final working list or contacted by telephone or personal interview. This procedure resulted in the selection of a working list of 262 possible employers of technicians in Vermilion County. Each of these employers was contacted by telephone to determine whether he did in fact employ technicians. Staff members were cautious about eliminating a possible employer of technicians

on the basis of a telephone conversation. Many visits were made to installations where such telephone conversations left doubt about the presence or absence of practicing technicians.

INSTRUMENTS USED IN THE STUDY

Development of Instruments

During the gathering and compiling of the lists of employers, two instruments were developed for use in this study. The first of these instruments was a structured interview for use by staff members in interviewing employers who had been determined to be employers of technicians. The second was a questionnaire to be filled out by technicians located during the interview with the employer. Both of these instruments were revised many times, and after revision were used in two separate pilot studies to determine their efficiency and applicability to this project. The first pilot study was run at the plant of MAGNAVOX CORPORATION in Urbana, Illinois; the second at the plant of CATERPILLAR TRACTOR COMPANY in Peoria, Illinois. Both pilot studies resulted in further revision of both instruments. Highly qualified personnel from both companies were made available for these pilot studies and their criticisms appear as revisions in the final form of each instrument.

Appendix I contains the final form of the structured interview used by staff members as they interviewed the various firms which employed technicians. Appendix II contains alternate forms of the cover letter and a sheet of instructions used with the questionnarie filled out by the responding technicians.

Method of Application

Personal contact was used wherever possible throughout this survey. During the interview with the firms, technicians were identified and listed by name, and if the cooperation of the management of the firm was extended to the interviewers (and this cooperation was extended, except in a very few cases), the technicians were gathered into a group and given a short presentation by the interviewer on the purposes and nature of the project. During this meeting each technician was given a large envelope containing a cover letter, an instruction sheet, and a questionnaire (see Appendix II), plus an addressed and stamped envelope, together with the recommendations that each of them take these home, read the entire questionnaire, and fill out the questionnaire completely before returning it by mail. In the few places where interviewers did not have the opportunity for personal contact with each technician, the names and addresses of technicians were secured and the same material was sent by

mail, using an alternate form of the cover letter when appropriate. Return rate of questionnaires was higher where interviewers were afforded personal contact with technicians.

The vast majority of the firms extended cooperation freely and without limit. The general opinion among management of these firms was that they would be delighted to have a local source of highly trained technical workers, and they saw the report of this study as a possible means of communicating this fact to the general public. The interviewing of firms and contact with technicians proved to be a time consuming task. In some cases it was necessary to make eight or nine visits to the same industrial installation in order to complete the firm interview form and in order to contact technicians who worked on different shifts.

During the use of the firm interview form, it was discovered that some items on this form were not sufficiently developed to obtain accurate information which would lend itself to classification. It was therefore necessary to extend the definitions of some of the terms in this form in order to assure consistent classification of the information gathered. Such extensions of definitions and semantic difficulties noted by the interviewing staff are included in the discussion of the item-by-item response given later in this report.

Information from all forms was placed on IBM cards and analysis was done using the IBM 7094 computer and the IBM 1401 computer located on the campus of the University of Illinois. Details of analyses are given in the item-by-item discussion.

Response rate and Influencing factors

During the initial phase of the contacts with firms and technicians, the return rate of the technicians' questionnaires was a little above 70%. During the course of these contacts, however, the voters of Danville Unit District 118 defeated in referendum a proposal to raise school tax rates. Part of this proposal concerned Danville Junior College. Immediately after the referendum defeat, the rate of return of the technicians' questionnaires fell to below 50%, and interviewers identified the attitude among technicians that the results of this study made little difference - that Vermilion County was not destined to have a school which afforded an opportunity for technical education no matter what the results of this study. Attempts were made by interviewers to point out to technicians that this defeat had occurred in only one school district, and that this was not necessarily an irrevocable decision against technical education; but the effect of this attitude remained in spite of interviewers' efforts.

This unfortunate attitude on the part of the technicians and the consequent fall in the rate of return of the technicians' questionnaires made it necessary to delay the analysis of this project and to implement a far more extensive amount of follow-up by mail to non-responding technicians than had originally been anticipated. When enough time had elapsed, the technicians became more inclined to respond and the percent of return rose to 67%, or 344 responses from a total of 512 technician contacts. It is estimated that mail follow-up would have raised the original 70% response rate to an 85% response rate had it not been for the referendum defeat in Unit School District 118. Enclosed in the mail follow-up were the technician questionnaire and instruction sheet in Appendix II, and the cover letter in Appendix III.

Chapter 5

ANALYSIS OF FIRM INTERVIEW FORMS

The instrument used to gather information from and about the firms which employed technicians in Vermilion County was an interview form which was filled out by the interviewer during his visit to the employing company. This interview form is in Appendix I of this report. The information necessary to fill out this form often came from different sources within the same organization. It was necessary, particularly when dealing with larger companies, for interviewers to gather information from several different people within the company structure.

The first part of this form is concerned with identification of the person or persons contacted by the interviewer during his contact with the management of the company. Identifications of personal contacts within any company were recorded for the purpose of assuring continuity of contact in case it was necessary to make subsequent visits to this firm, or in case a different staff member was assigned the job of completing the contact with any business installation. The contact classification of hired manager and owner-manager appear most frequently as the initial contact with most firms. Interviewing staff members discovered that initial contacts at lower levels of management usually required subsequent contact at higher levels of management to obtain authorization for the necessary cooperation of the firm's personnel.

CLASSIFICATION OF FIRMS

A total of 80 firms employing technicians were discovered in Vermilion County. Each of these firms was visited personally by an interviewing staff member, and the rate of response from these firms was 100%. The products, services, and functions of these firms were quite diverse. Rough classification of these firms was accomplished by use of their occupational code numbers registered with the State of Illinois Employment Service, and this classification was continued by hand using the listed products, services, and functions on the interview form. Some of these firms had several occupational code numbers, and where this was the case the major function of such companies was

selected for classification. Final classification revealed that 31 of these firms operated primarily in the mechanical or machinery field; 20 of these firms were associated to one extent or another with the building trades; 18 of these firms were in the electrical-electronic field, and 11 of these firms were in the general field of chemistry or food processing. This is not to say that there did not exist an overlapping of functions by firms included in any of these rough classifications. The opposite condition was true; many of these firms had extended their operations into various fields, and many of these firms employed technicians who worked in several different fields of technology. The only conclusion available from this classification is that the three important fields in which the employing firms worked were Mechanical, Electrical-Electronic, and Chemical Technology.

FUNCTIONS OF FIRMS

The section of the interview form dealing with functions of these firms revealed by frequency count that manufacturing was the major function of most of these 80 firms, with 13 reporting major operations of job shop nature and 26 reporting major operations of a mass production nature. Many firms reported both of these functions, indicating that they engaged in both job shop and mass production operations. The next largest response was in the major operation of service. Service was defined by interviewers as servicing the manufacturer's product in the field, or servicing this product after it was in the hands of the customer. "Service" is one of the items upon which the interviewing staff agreed that an extension in definition was necessary. Other similar items in this list were the term "constructing", which was defined as building and erecting structures; the term "processing", which was defined as chemical processing or an operation performed upon some object which did not produce a significant change in its physical form; "contracting", which was defined as manufacturing upon order with sale insured before manufacture; and "installation", which was defined as installing the firm's own product. Relatively heavy response in the major category of processing indicated the presence of the chemical industry, and the relatively heavy response in the significant category of purchasing indicated that many of these firms did their own purchasing—that is, they were independent operators who did not have facilities for central purchasing.

ENGINEERS EMPLOYED BY FIRMS

The three items in this interview form concerning engineers

revealed the following: only three of the 80 firms interviewed required professional registration as a prerequisite for employment of engineers. The choice of the word "required" was an unfortunate choice in this item. Many companies stated to interviewing staff members that they would prefer professional registration for engineers, but that they would not require professional registration for employment of engineers.

Responses concerning the percent of engineers who could be replaced by competent, well-trained technicians indicated that 95 of the 184 engineers employed by these companies could have been replaced by well-trained technicians. This was approximatley 50% of the engineers employed by these 80 companies, and such reaction to these items reinforces a statement made earlier in this report: "It is quite possible that the current shortage of engineers is only an apparent shortage, that many engineers work as technicians because technicians are not available, and that the real shortage exists in the ranks of the technicians."

There are two facts which make it quite probable that the total of 95 replaceable engineers was a conservative figure. The first is the fact that only 12 of the 80 firms responded to either of the related questions. The second is the fact that the word "replaced" was used. This word impled to the management of these firms that a "replaced" engineer would be dismissed as a result of replacement by a technician. Staff members noticed during interviews that management objected to this implication of the wording of the interview form, and stated that they had no intention of replacing any of their engineers, but that they would like to release these engineers from tasks which could be done by competent technicians and assign these engineers to work more suited to their training and abilities. Had the wording of this item conveyed the intended meaning of release for reassignment, with no implication of dismissal, the response from management might have been higher.

TECHNICIANS EMPLOYED BY FIRMS

During the execution of this study, discussion with both employers and technicians revealed a fact that serves to further emphasize the unique position occupied by technicians in the engineering manpower team. The first work assignment of a newly graduated and newly hired engineer was often an assignment which placed the recently graduated engineer in a position where he acquired additional training at the hands of experienced technicians. This seemed to be particularly true in the mechanical and electronics field, but it may have seemed this way only because these two fields were heavily represented

501061

in Vermilion County. Experienced technicians were sometimes assigned to teach newly graduated engineers and to familiarize them with the specific practices of an individual industrial installation. The attitude of management here was that a new engineer must learn the practicalities of the trade and become familiar with the capabilities of the technicians in order to make efficient contribution to the engineering function. However widespread the practice of initially assigning engineers to technicians for a period of learning might be, its very existence points out that engineering graduates are not trained to be technicians, and that a competent technician has his own distinct specialized place in the engineering manpower team.

Classification of Technicians

During identification of technicians employed by the firms, a system of classification of technicians was explained to the management of these firms, and they were asked to classify the technicians whom they employed into three major classifications. (See Figure I.)

The Engineering Technician

The engineering technician was defined as a technician who works primarily in direct contact with creative engineering. He should have two years of college level training in his field, or its equivalent. He is usually capable of original design and of making educated decisions within his specialty, and he may or may not work under the direct supervision of an engineer on projects within his specialized field.

The Industrial Technician

The industrial technician was defined as a technician whose specialty is closer to the production facilities of the industry than to the creative engineering function within the industry. His educational qualifications are set at approximately one year of post-high school level training, or its equivalent. He is not as capable as the engineering technician of working directly with or under the supervision of professional engineers; his specialties are directed toward the intensely practical problems associated with the production capacities of the industry. This technician is likely to be even more specialized than the engineering technician as defined above. Many industrial technicians are the products of many years of experience at one particular operation, and many are deeply involved in assisting with production planning.

The Technical Specialist

The technical specialist was defined as an even more highly specialized technician who has developed a skill or facility, the use of which constitutues his major occupational function. He is usually not a supervisor, but instead a highly competent performer at some particularly complex task. An example of the technical specialist is the technician who specializes in measurement and the use of complex measuring instruments. The instruments he uses may be highly complex mechanical or electronic devices, and this technician probably knows more about their practical application than anyone else. There are a multitude of these specialties. Another example here is the specialist who understands and can use effectively the various items of supporting equipment for an electronic data processing system.

Distribution of Technicians

Table 1 shows the distribution of responses from the firm's classification of the technicians they employed. Many of the technicians listed in Table 1 worked in more than one field of technology, but for classification, only the major field of technology of each technician was used. The frequencies furnish further support to the conclusion derived from classification of the firms. The three most frequently encountered fields of technology in Vermilion County were, in their order of size, Mechanical, Electrical-Electronic, and Chemical Technology. It should be remembered that Table 1 is a representation of employment distribution at the time this study was made, and that it does not imply that any other field of technology is of relative minor importance. It may, indeed, mean that some kinds of technicians were not widely employed in this community simply becuase they were not available in this community.

The high frequency of industrial technicians in Mechanical Technology suggests that this industry in Vermilion County was more oriented toward production engineering than toward creative engineering. This tendency was also observed by the staff of this project, who noticed during contacts with industry that many firms in this County which engaged in high production manufacture did not become individual subjects of this survey because they had no local facilities for the engineering function. There were a noticeable number of companies in Vermilion County who were subsidiaries of larger corporations and whose engineering facilites and associated technicians were not located in this County. These companies used Vermilion County as a

TABLE 1

DISTRIBUTION OF 512 TECHNICIANS IN FIELDS OF TECHNOLOGY BY RESPONSES OF EMPLOYING FIRMS

	Engineering Technicians	Industrial Technicians	Technical Specialists	Totals
Mechanical	78	123	60	261
Electronic	41	17	24	82
Chemical	20	42	15	77
Electrical	32	6	5	43
Data Processing		18		18
Civil	13			13
Architectural	3			3
Ceramic		2		2
Metallurgical	1			1
Unclassified			12	12
TOTALS	188	208	116	512

source of semi-skilled and unskilled labor. When such firms did employ technicians, these technicians were likely to be few in number, and they were likely to be supervisory personnel.

Job Stability and Security

The percent of turnover figures were included in the firm interview form in order to gain some insight into the relative job stability and job security of the technicians in comparison

to the entire working force of the employing firms. The 80 firms interviewed certainly did not employ the total working force in Vermilion County, nor were sampling techniques used in order that statistical inferences could be drawn about the total working force in Vermilion County.

Various turnover figures gathered from the 80 companies interviewed, however, showed a decided superiority in favor of the technicians in job stability and job security. The total turnover rate for the engineering technicians was 1.56%; for the industrial technicians, 2.66%; for the technical specialists, 4.4%. For the entire working force employed by these 80 companies the labor turnover rate was a quite high 14.3%. These figures are not averages of turnover rates. The figures given were computed upon the basis of the total number of employees turned over per year by these 80 companies.

Training Programs

Responses to the last few items on the first page of the interview form indicated that, of the 80 firms interviewed, 50 firms operated a training program for technicians. Data were incomplete on the number of men trained yearly by these firms because 20 of these 50 firms did not report this number. The remaining 30 firms indicated that they had a total of 171 technicians in various types of training programs. Twenty-one firms reported a continuous training program in operation for technicians, and others reported various programs ranging in length from one month to 36 months. Formal or in-class training was reported by four firms, informal on-the-job training was reported by seven firms, and other various types of training were reported by ten firms. These other types of training included financial assistance through tuition refund at various institutions (Danville Junior College was mentioned frequently here), technical seminars, apprentice programs, manufacturers' short courses, adult education classes, and correspondence courses.

There is no kind of training which can be accomplished without expense, and over a period of years the firms who trained their personnel had undoubtedly invested an impressive amount of money in the education of these technicians. When all this is considered, it seems quite logical for these employers of technicians to discourage, in one way or another, a high turnover rate among their technicians. Technicians in Vermilion County were (at the time this study was made) in short supply, and management obviously did not enjoy the prospect of attempting to replace a technician who left his job.

Requirements for Initial Hiring

Educational

In filling out the items in the firm interview form concerning the minimum requirements for technicians employed by the firm, each interviewer was careful to secure the absolutely minimum amount of education acceptable to the firm for initial hiring in the classifications of engineering technicians, industrial technicians, and technical specialists. Employers preferred, of course, to hire personnel with as much training and experience as possible, but there is no indication of such preference in the data collected by these items. These data represent absolute minimums of educational attainment in order for an applicant to be considered for a job as a technician. Under pressure for extreme minimums in educational requirements, 11 of the responding firms admitted that they would consider high school graduates with no post-high school training as possible applicants in the engineering technician classification. Most of the firms who would respond in this manner were careful to point out to the interviewer that this would be true only if absolutely no one else were available, and that much training would be necessary before high school graduates could hope to function in this capacity. The most usual stopping place as interviewers pressed for lower minimum requirements was at the level of the post-high school technical school. The most usual reaction of management at this point was that it was not realistic to hire in this capacity anyone who had not attended such a school. Nine of the reponding firms insisted on a college degree at this level.

The same procedure when applied to the classification of industrial technicians revealed tha 28 of the responding firms would accept high school graduates, one stopped at the level of high school plus post-high school correspondence school, 18 stopped at the level of the post-high school technical school and three firms insisted that a college degree was necessary for satisfactory performance in their particular operation as an industrial technician.

For the technical specialist, 20 firms agreed that they would accept high school graduates, one firm insisted upon post-high school business school, 10 firms insisted upon post-high school technical school and one firm upon a college degree.

Concerning minimum years of work experience as a prerequisite to being considered for employment, 12 firms responded for the engineering technician with a range of from one to five years and a mode (or most usual response) of two years of experience.

For industrial technicians, 16 firms responded with the same one to five year range and the same most usual response of two years of experience. For technical specialists, nine firms responded with the same range of from one to five years and a most usual response of two years of experience.

Age Ranges

The firms in Vermilion County indicated to the interviewing staff members that they were willing to hire technicians in a surprisingly wide age range. Minimum and maximum age ranges within which the responding firms stated that they would hire technicians are shown below. The median ages shown are the middle (or midpoint) of the responses; the modes are the most frequent (or most usual) of the responses.

	Minimum Range: 18-50		Maximum Range: 25-65	
	Median	Mode	Median	Mode
Engineering Technicians	22	25	39	30
Industrial Technicians	25	25	40	35
Technical Specialists	18	18	35	35

The age ranges above should have definite meaning to people who might consider retraining themselves to work in one of the many fields of modern technology. Consideration of the medians, modes and upper limits of the maximum age ranges in these three categories suggests that any person above 40 years of age who wishes to acquire skills to enter a technical field should not be satisfied with a minimum amount of training. Instead, it implies that above the age of 40 years a complete retraining schedule would be more desirable. The relatively high maximum age limit also tends to support the viewpoint that competency was the first and foremost consideration in hiring technicians.

The management of the employing firms was consistent here; the responses given to the items concerning minimum requirements for technicians as prospective employees definitely indicated that these employers did not wish to hire newly graduated high school students and train them as technicians; the response to the starting age range indicated the same thing. These employers preferred that applicants be enough older than the average high school graduate to have had post-high school training.

Additional Requirements and Considerations in Hiring

When employers were asked to state specific additional requirements for employement of technicians, 31 firms re-

sponded. Thirteen of the firms mentioned specific additional requirements concerning the academic background of the applicant, and eight indicated that the firm used some test or series of tests for all applicants. Two responses referred to personality traits which would be useful in meeting the public, and the remaining responses are so diverse as to defy classification.

In reply to questioning about any additional considerations in hiring technicians, 39 firms responded. Twenty-three of these firms mentioned personality, attitudes, and personal appearance as additional considerations. Eleven firms mentioned communication skills and ability to meet the public, six firms mentioned completion of military service as preferable, and five firms mentioned job experience. The remaining responses were, as above, too diverse to classify. In neither the case of additional requirements nor the case of considerations in hiring did other than occasional responses indicate that requirements and considerations were different for any of the three classifications of technicians—except for the minimum education requirements previously stated.

Salary Ranges Stated by Employers

When the salary range of technicians was considered during the interview with management, management personnel were asked to give a low or starting and a high or top salary for the three classifications of technicians. The applicants for the technician's job were defined as the people they ordinarily found available for such work. Because the applicants for this sort of work in Vermilion County displayed such varied degrees of training and competency, the range of responses was quite wide. If these firms had been able to hire technicians with uniformly competent training, the range of responses to these items would not have been so great. These employers, however, stated the salary at which they would expect to hire an applicant for each classification, and they furthermore stated the maximum salary which such an applicant could expect to make if his demonstrated capabilities proved satisfactory in every way. These figures represent the approximate minimum and maximum salaries for each classification of technician.

Salaries are reported by giving only the median (or midpoint) of the range of responses for each classification. One reason for this is that many employers stated that they were not approached by applicants with the qualifications which they desired. Another reason is that staff members occasionally considered the figures that a few employers gave as not quite realistic. Also, some of these salaries were reported in terms of

hourly, weekly, or monthly wage rates, and these may have suffered some inaccuracy in transformation to yearly salaries. Median values are presented in tabular form below:

Table 2

MEDIAN SALARIES FOR TECHNICIANS AS REPORTED BY 80 EMPLOYING FIRMS

	Median Starting Salary	Median Top Salary
Engineering Technician	$5,100	$7,800
Industrial Technician	$4,170	$6,470
Technical Specialist	$4,130	$5,780

The range of responses given by employing firms indicated that it was quite possible for experienced and highly qualified engineering technicians and industrial technicians to earn an annual salary of $10,000 or more in Vermilion County, and this was verified by the salary figures given by the responding technicians.

Influence of Additional Training on Starting Salaries

When employers were asked to state whether additional training to adequate level would make a difference in the starting salary the firm would pay technicians, their responses were quite varied. Many employers gave negative answers and stated that they would prefer for a new employee to earn a raise in his salary. For the 26 firms who did respond positively to this question, the mode (or most usual response), and the median (or midpoint) of the responses was approxiamately $1,200 per year for engineering technicians; for the 34 firms who responded positively for the industrial technician the median was approximately $600 per year; and for the 17 firms who responded positively for the technical specialist the median was approximately $600 a year also.

The remaining portion of the information gathered from the employers of technicians is presented later in this report. The opinion of the management of the employing firms on the training of presently available technicians has been consolidated for presentation and comparison with the opinions of the technicians, who responded to the same questions on the questionnaire which they filled out. Presentation of another portion of this form relating to trends in employment appears in Chapter 8.

Chapter 6

ANALYSIS OF TECHNICIAN QUESTIONNAIRES

The first portion of this chapter is descriptive material composed of facts supplied by responding technicians. The response rate of the technicians in Vermilion County who were contacted during the course of this study was 344 respondents from a total of 512 identified and contacted, or 67% response.

As previously stated in this report, this study was limited to technicians who do work associated with the engineering function in industry. There are many others in Vermilion County who are technicians (or who are called technicians), but no attempt was made to identify, classify, or contact these technicians during the execution of this study.

EDUCATIONAL HISTORY OF TECHNICIANS

By far the most frequent curriculum studied by responding technicians when they were in high school was the college preparatory curriculum, with 136 reporting this curriculum and 86 reporting various other types of curricula. The distribution of responses giving the size of attended high schools indicated that most frequent attendance was in high schools with a student population of more than 1,000, with the next most frequent attendance in high schools with a student population of between 100 and 300. Of the 322 technicians who responded to the item relating to the location of the high school attended, 145 (or 45%) stated that they attended high schools outside of Vermilion County, with 53 stating that they attended high schools within the State of Illinois but outside Vermilion County, and 92 stating they attended high schools outside Illinois

Formal post-high school education was reported by 142 of the responding technicians. One hundred one reported from one to three years of such education with a mode (or most usual response) of two years and 41 reported from four to seven years with a mode of four years of such education. Extensive investigations into the influence of these 41 baccalaureate degree (or four year equivalent) respondents did not discern any significant difference between these respondents and other respondents. It seems that two years of specialized formal post-high school education was the most efficient for technicians, and that addi-

tional education leading to a baccalaureate degree showed no significant advantage for a practicing technician.

Below is a tabular summary of data concerning other forms of post-high school education:

	Mode(s) (most frequent responses(s)	Approximate Median (midpoint of responses)	Range of responses	Number of affirmative technician responses
Extension or night classes	1 year	1 year	1 to 6 yrs.	76
Armed Forces Schools	4 months	6 months	1 to 50 mos.	109
Correspondence courses	4, 12, & 24 months	11 months	1 to 72 mos.	91
Industry schools	1 month	5 months	1 to 48 mos.	68
On-the-job training	70 hours	70 hours	10 to 1000 hrs.	114

Apprenticeship: 59 technicians reported apprentice training; no description or length of training was given.

PERSONAL AND JOB HISTORY OF TECHNICIANS

The 341 technicians who responded to the item regarding age gave their range in ages as 19 to 73 years, with an approximate median age of 34.5 years. Three hundred twelve technicians reported that they were married, 17 reported that they were single, and seven reported that they were divorced or widowed. The most usual number of children in the families of these technicians was two, with 109 of the responding technicians reporting this size family. Two hundred fifty-six technicians reported that they owned their own home, and most of these homes were undoubtedly located in Vermilion County (and probably in the immediate vicinity of the City of Danville), since 304 technicians also reported that they lived within a distance of 10 miles or less from their place of work.

SALARIES REPORTED BY TECHNICIANS

Salaries were reported by 309 of the responding technicians, with 14 of these 309 reporting part-time jobs with annual salaries of less than $2,000. Neglecting these 14 part-time technicians and considering only the 295 full-time technicians, the salary range reported was from $2,000 to $13,000 with an approximate

median of $6,300, an approximate mode of $6,500 and a mean (a computed arithmetic average) of $6,605.

JOB OBJECTIVES AND JOB CHANGES

Responses of the technicians regarding the job objectives they had when they graduated from high school were classified and are listed below in descending order of frequency:

Objectives	Frequency of Responses	% of total
1. No response or no definite objectives.	160	46.5%
2. Objectives comparable to current position but different.	61	17.8%
3. Objectives greater than current position	49	14.2%
4. Objectives same as current position.	42	12.2%
5. Objectives of lesser status than current position.	32	9.3%

Regarding the reasons for following the line of work in which they were engaged, the technicians responded as follows:

Reasons	Frequency of Responses	% of Total
1. Incidental industrial opportunity (including salary attractions).	100	29.1%
2. Individual interest in this type of work.	100	29.1%
3. Armed Forces placement (or training).	19	5.5%
4. Personal influence of a friend	13	3.8%
5. Public school teacher influence.	2	.6%
6. Public school guidance.	1	.3%
7. Unclassified	80	23.2%
8. No response	29	8.4%

One hundred seventy-three of the responding technicians reported that they had made no job changes during the past five years. Ninety-two technicians reported two job changes during the past five years, making a total of 318 of the 344 responding technicians who had made two or less job changes during the past five years. The remaining 25 technicians reported from three to six job changes, bringing the total for the entire group to 286 job changes during the past five years. The responding technicians' lists of the salary ranges associated with job changes revealed that 212 of these job changes involved increases in salary.

It would be easy to assume that technicians changed jobs only for salary increases, but such is not the case. Increase in salary was an important reason for job changes, but it was not the only reason. This is shown by the classification below of reasons given by the responding technicians as major reasons for job changes during the past five years:

Reasons for Job Changes	Frequency of Responses
1. Increase in salary	43
2. Employing firm ceased operations (or lay off)	26
3. More responsibility	20
4. Advancement	19
5. Working conditions	19
6. Personal conflict	10
7. To work in an area for which technician was trained	5
8. Other unclassified reasons	32

When technicians were asked to state the number of years they had been employed by their present employer, 340 responses were given with a range of from less than one year to 48 years and and approximate median of five years of employment by the present employer. The approximate median of these responses can easily be verified by responses previously presented, wherein 173 respondents listed no job changes during the past five years and 170 respondents listed no reasons for job changes during the past five years.

JOB FUNCTIONS OF TECHNICIANS

The first page of the technician questionnaire contains a

list of 53 job functions (see questionnaire in Appendix II). Technicians were requested to respond to each of these as follows:

0	for things you do not do
X	for things you do only occasionally
XX	for things which you do more regularly, but which do not take much time, or which are a minor part of your work
XXX	for things which take major portions of your time, or which are a major part of your work
XXXX	for things which take all, or almost all, your time, or things at which you are normally a full-time specialist

Responses of the technicians to the random arrangement of 53 job functions were used to arrange job functions in relative order of frequency of performance by computation of a ranking factor for each job function. The sums of each of the selective responses indicating frequency of performance of each job function were taken and the ratios of these sums were computed. For rank ordering in relative frequency of performance of job functions, the ratios were approximated and ranking factors were computed as follows:

Responses indicating frequency of performance:	0	X	XX	XXX	XXXX
Sums of responses:	11314 +	3527 +	1963 +	911 +	517 = 18232 = 344 x 53

		Ratios Computed	Approximations used
$\frac{3527}{3527}$	=	$\frac{1}{1}$	$\frac{1}{1}$
$\frac{3527}{1963}$	=	$\frac{1.8}{1}$	$\frac{2}{1}$
$\frac{3527}{911}$	=	$\frac{3.9}{1}$	$\frac{4}{1}$
$\frac{3527}{517}$	=	$\frac{6.8}{1}$	$\frac{8}{1}$

$$\text{Ranking Factor for each Job Function} = \begin{array}{l} 1 \times (\text{sum of X responses}) \\ + 2 \times (\text{sum of XX responses}) \\ + 4 \times (\text{sum of XXX responses}) \\ + 8 \times (\text{sum of XXXX responses}) \end{array}$$

These ratios (1, 2, 4, and 8) place more weight on the technicians' responses as these responses indicate increases in proportion of time each function occupies. The highest ratio (8) used for the XXXX responses was arbitrarily increased from the computed 6.8/1 ratio in order to provide for technicians reporting true full-time specialization in a particular function. Figure VI shows these 53 job functions arranged in rank order by size of the ranking factors computed with this formula. The responses from which this Figure was set up are in Appendix IV.

If one fact is not kept in mind when considering Figure VI, this rank order of frequency of performance of job functions can be misinterpreted. This important consideration is: Figure VI is a representation of the order of job functions performed by the reporting technicians. It does not necessarily represent the relative importance of each job function, or of any single job function as applied to the ideal or desired functioning of a competent technician. For example: 12 technicians reported that data processing took up major portions of their time or that they were full-time specialists in this area. Management of many firms which employed technicians indicated to interviewers, however, an intense interest in data processing, and several firms were investigating the possibilities of the use of data processing in their operations. These firms were all aware of the newly implemented data-processing curriculum offered by Danville Junior College, and many management personnel were pleased at prospects of being able to hire people qualified in this field. It may easily be, then, that the reason that data processing does not rank higher is that there had been no local supply of people trained to perform this particular task. In the job function described as "Applying Mathematics to Design", 217 responding technicians reported that they were not so engaged. Later in this report, it is shown that the employers of these technicians considered them to be, in general, inadequate in mathematics. It is probable that many technicians in Vermilion County did not perform this particular function, and were not assigned to jobs that required this particular function, only because their training left them incapable of "Applying Mathematics to Design".

Thus the rank ordering of the job functions of Figure VI

Figure VI

RANK ORDER OF 53 JOB FUNCTIONS
FROM RESPONSES OF 344 TECHNICIANS

should be considered as only what it is: an approximation of the relative frequency of the activities in which the technicians in Vermilion County were engaged. Had management of the firms (or the technicians themselves) responded to this list of job functions with regard to desirability of performance by a technician, the rank order of desired performance might have been very different from the rank order of actual frequency of performance.

Using Figure VI as it is intended to be used and keeping in mind its limitations, it is still possible, however, to gain certain impressions about the technicians in the industries of Vermilion County. The relatively low rank order of items which mention or imply contacts outside the firm conveys the impression that most of the work of these technicians was done within the firm and that most of their personal contacts were with other people who work within this firm. The next impression is that many of these people were functioning as supervisory personnel whether or not this was a stated part of their job. Concurrent with this is the impression that these people engaged to a marked extent in the interpretation of engineering or scientific facts, processes or procedures to those whom they supervised. From the relatively high rank order of items 4 through 8 plus items 11, 12, and 14 comes the impression that these people consistently practiced the application of their own skills in conjunction with the engineering function of the employing firm. The high rank order of items such as 9 and 10 and other items which mention or imply job functions allied with the production process suggests the presence of industrial technicians (as industrial technicians are defined for the purpose of this report), and may also suggest that some engineering technicians in Vermilion County functioned in an advisory or supervisory capacity in the production process.

DISTRIBUTION OF TECHNICIANS IN FIELDS OF TECHNOLOGY AS REPORTED BY TECHNICIANS

The even decline in frequency shown by the items included in the lower part of Figure VI suggests a wide dispersion of activities on the part of these technicians, and this is undoubtedly true since these technicians worked in many varied fields of technology and since each technician reported his frequency of activities without regard to the technology in which he worked. This impression is substantiated by the fact that there are only six items on this list of job functions, (numbers 24, 30, 48, 49, 52, and 53) in which no responding technician classified himself as a full-time specialist. Many of these technicians,

moreover, worked in more than one field of technology. The responding technicians classified themselves as follows:

TABLE 3

DISTRIBUTION BY FIELDS OF TECHNOLOGY

Field of Technolgy	Number of Technicians
Mechanical	122
Electrial	26
Electronic	48
Chemical	44
Mechanical-Electrical	29
Mechanical-Electronic	7
Mechanical-Chemical	16
Mechanical-Electrical-Electronic	5
Mechanical-Electrical-Chemical	3
Electrical-Electronic	14
Mechanical-Electrical-Electronic-Chemical	2
Civil	7
Data Processing	5
No response and unclassified	16

The above classifications are the results of grouping from even more widely diverse fields of technical work. The high frequency of mechanical technicians, electrical and electronic technicians, and chemical technicians among those responding again points out the relative importance of these technologies in the industries of Vermilion County. This relative importance is in exact correspondence to the conclusions derived from the information gathered from the firms employing these technicians. Responses from both the technicians and employing firms indicate that approximately 50% of all the technicians who work in Vermilion County work either full time or part time in the field of Mechanical Technology.

Responses by technicians identified in the major fields of technology are shown in Table 4.

One cannot add the columns below and expect meaningful totals. For example: technicians who reported work in both mechanical and electronic fields are included in each of these part-time totals (62 and 76).

TABLE 4

DISTRIBUTION OF TECHNICIANS BY MAJOR FIELDS OF TECHNOLOGY IN VERMILION COUNTY

	Number identified by firms	Number reported full time this field	% response full time this field	Number reported part time this field
Mechanical	261	122	46.7%	62
Electronic	82	48	58.6%	76
Electrical	43	26	60.5%	53
Chemical	77	44	57.1%	21

JOB FUNCTIONS OF TECHNICIANS IN SPECIFIC FIELDS OF TECHNOLOGY

In Tables 5, 6, 7, and 8, job functions are listed in descending rank order of frequency of performace according to responses of technicians in the various major fields of technology (and combinations thereof) which were found in Vermilion County. These are the same 53 job functions shown in Figure VI but they are arranged in different order because of the varying job functions of technicians who work in different fields.

TABLE 5

RANK ORDER OF 53 JOB FUNCTIONS FROM RESPONSES OF 122 MECHANICAL TECHNICIANS

	Frequency of Responses					
	0	X	XX	XXX	XXXX	Ranking Factor
1. Reading blueprints	12	13	37	38	22	415

Chapter 7

COMPARISON OF OPINIONS OF TECHNICIANS AND EMPLOYING FIRMS ON 20 ACADEMIC AREAS

Contained in both instruments used in this study are identical lists of 20 academic areas which both management and technicians were requested to classify with regard to relationship to the job of a technician and with regard to adequacy of training of presently available technicians (see page two of the firm interview form in Appendix I and page four of the technicians' questionnaire in Appendix II).

There is one caution to observe when considering the following discussion; it was possible for a respondent to confuse the terms "adequate" and "unrelated". During interviews with the employing firms, interviewing staff members often found a tendency to classify one or more of the 20 listed academic areas as "adequate" because the employer felt that proficiency in some particular academic area was not necessary for the performance of the technician's job, or that any training a technician had received was "adequate" if he did not need it to perform his job. The intent of the questionnaire and the interview form was, of course, to have such academic areas classified as unrelated to the job of a technician. Interviewers were able to control this semantic difficulty during the interviews with the employing firms. Such control could not be exercised, however, when the responding technicians filled out their questionnaires at home. It is therefore possible that some technicians' responses which should have been "unrelated" have found their way into one of the columns which relate to adequacy.

CORRELATION OF OPINIONS REGARDING JOB RELATIONSHIP

Table 9 contains lists of the 20 academic areas in descending order of high relatonship according to the opinions of the employing firms and groups of technicians identified (by technicians' responses) in various fields of technology encountered in Vermilion County. The rank order of relationship given by totaled responses of the 344 responding technicians is not shown because there is little to be gained by comparing a full or 100%

response by the management of the employing firms with varying percentages of responses by technicians who work in different fields of technology.

In order to determine whether basic agreement on job relationships of these academic areas existed between employers and employees, however, a statistical computation of a coefficient of correlation between the rank orders of relationship set forth by the totaled responses was performed. The rank order correlation coefficient used was the Spearman rho, and the value computed for this coefficient of correlation was .91. Perfect agreement would show a coefficient of correlation of 1.00. Further investigation of the values here reveal a level of confidence of more than 99%, which means that there is a mathematical probability of more than 99% that the agreement in rank order set forth by the opinions of the 80 employers and the 344 responding technicians is significant — that it did not just happen by chance.

COMPARISON OF RANK ORDERS OF RELATIONSHIP

The most important of the implications of Table 9 concern those academic areas which consistently appear in extreme positions at the top and bottom of the various rank order lists. The items which consistently appear at the extreme top of the lists are academic areas which were of extreme importance to practicing technicians in Vermilion County. The academic areas which consistently appear at the extreme bottom of these lists were of generally minor importance to the job of a technician.

It would be ideal if a student were able to acquire knowledge in all academic areas which could make any contribution, however small, to his future proficiency in work for which he is preparing, but limitations imposed by available time prevent accomplishment of this ideal. It is always necessary to select for presentation to students the most basic and essential portion of existing knowledge pertaining to any subject. When choices must be made from various academic areas for technical education, the order of relationship of any particular academic area to the job of the technician becomes of paramount importance. The implications of these relationships are applicable to both post-high school technical education and to choices in preparatory or supplementary high school courses which should be considered as prerequisites for entrance into a post-high school technical school.

Implications of Rank Orders

The consistently high order of relationship assigned to mathematics by both employers and technicians should have definite implications for curriculum design in technical education. The relation of mathematics to tl. job of the technician has been investigated by others. Mathematics is of major importance in the work of the technician.[16]

During conversations with interviewers, several technicians and many employers stated the opinion that a technician's progress is limited by his ability in mathematics, and by his ability to apply mathematics. The ability of a student to grasp a curriculum offered in technical education is also limited by his facility with mathematics. In both the study of scientific theory and the study of the application of scientific theory, a student or practicing technician will encounter mathematics as he learns other subjects. If a technician does not develop proficiency with mathematics, this lack of proficiency will impose definite limits upon his ability to develop competency in other subject matter areas. Many different opinions exist about the levels of mathematics necessary for efficient performance by technicians in the varied fields of technology, but the undoubted importance of mathematics plus the suggestion that the technician's progress may be limited by his facility with mathematics should supply sufficient encouragement for a practicing technician (or a student who wishes to become a technician) to acquire all the proficiency with mathematics he possible can.

The high rank order positions of the items "English", "Speech", and (in most cases) "Technical Writing" demonstrates that both technicians and employers considered communication skills of high importance to a technician, with employers considering these items as even more important than they were considered by technicians. This is particularly logical when it is remembered that the technicians in Vermilion County have been previously shown to be involved in supervisory functions. Proficiency with communication skills is of extreme importance to a supervisor.

Implications of Variation in Rank Orders

There are also implications suggested by the variation in the rank ordering of the various academic areas by technicians who work in different fields of technology. For instance, the item "Chemistry" is, of course, of major importance to chemical technicians, of much less importance to electrical-electronic technicians and of relatively minor importance to mechanical technicians, including mechanical technicians who also work in

the electrical and electronic fields. This suggests that curriculum designs for the electrical and electronic fields should select from chemistry only those parts of this academic area which have direct application to this field of technology, and that curriculum designs for Mechanical Technology (if they include chemistry at all) should be even more highly selective.

Another example is the item "Physics". Technicians who work in the field of Mechanical Technology, including those who also work in the electrical and electronic field, rank the item "Design or Mechanisms" above "Physics" in relationship to their jobs. The implication here is that physics should be presented not in the form of a conventional college course, but that selected applicable topics of physics should be presented as prerequisites for courses in mechanisms.

A similar implication in another field of technology is apparent in the order of rank assigned by technicians in the electrical and electronic fields to Electricity, Electronics, Physics, and Design or Mechanisms (see Table 9). The implication here is that curriculum designs for these technologies should also include selected applicable topics of physics.

The topic selections for Electrical-Electronic Technology would not, however, be the same as those made for Mechanical Technology. When limitations imposed by time are considered, it becomes obvious that one standardized conventional college-level course in physics cannot be presented in an extent sufficient to meet all the diverse needs of different technologies. Inconvenient as it may be, technicians are specialists, and they need specialized courses.

CORRELATION OF OPINIONS REGARDING ADEQUACY OF PREPARATION

In order to further compare the opinions of the technicians and the employing firms, a formula was used with the responses relating to adequacy of preparation in the 20 listed academic areas. This formula is as follows:

$$\text{Ratio of inadequacy for each of the 20 academic areas} = \left(\frac{\text{Number of "barely adequate" responses} + 2 \times (\text{Number of "inadequate" responses})}{\text{Number of "adequate" responses}} \right)$$

The arbitrary part of the formula given above is the factor (2) by which the number of "inadequate" responses is multiplied. This factor is necessarily an arbitrary one because there is

no mathematically precise way to find the ratio between a "barely adequate" performance and an "inadequate" performance in any academic area or in any job function. The use of this arbitrary factor weights more heavily the influence of the responses given in the inadequate classification for each academic area. The formula above gives a ratio of overall inadequacy to adequacy, and when used with both the opinions of technicians and the opinions of employing firms, furnishes a basis for comparison of these opinions.

In order to determine whether basic agreement regarding adequacy (or inadequacy) existed between employers and the 344 responding technicians regarding the 20 listed academic areas, the Spearman rho rank order coefficient of correlation was used. Between rank orders based upon ratios of inadequacy set forth by the two different group opinions, the value computed for this coefficient was .65, which is not as high as the value (.91) obtained when relationship was considered. There is, however, the same level of confidence of more than 99% for both coefficients of correlation. Although management of the 80 employing firms and the 344 responding technicians were in basic agreement regarding both relationship and adequacy (or inadequacy) in these 20 academic areas, they agreed more in the order of relationship to technicians' job than in the order of adequacy of academic preparation or performance.

COMPARISON OF OPINIONS REGARDING ADEQUACY OF PREPARATION

In only three of the listed academic areas - English, Speech, and Wood Shop - did the 344 responding technicians (according to the stated ratio formula) feel that they were more adequate than inadequate, and in Chemistry and Shorthand the technicians expressed more feelings of inadequacy than management of the employing firms. With the two exceptions just noted, the ratios of inadequacy according to the employing firms were larger than the ratios of inadequacy according to the technicians. There is nothing unusual in an employer being more critical of an employee than the employee is critical of himself; the only unusual aspect of the opinons on inadequacy is that the responding technicians were so inclined toward self criticism. The technicians' generally well organized and intelligent manner of response, both here and in the unstructured responses, lends a certain aura of authority to their opinions.

Table 10 shows comparisons of the opinions of responding technicians and employing firms regarding inadequacy of the 20 academic areas listed in both the firm interview form and

the technicians' questionnaire. These 20 items are arranged by rank order of high relationship to the job of the technician according to opinions given by employing firms, but the important aspect here is in the ratios of inadequacy, not in the order of listing. Since the two left columns of Table 10 represent opinions of 80 employing firms and 344 responding technicians, these two columns can be considered as a general criticism of the academic preparation of the practicing technicians in Vermilion County.

In several instances there was no significant difference in opinions relating to inadequacy as given by the 80 employers and the 344 responding technicians, and these are indicated on Table 10. Each set of frequency responses for each of the 20 listed academic items was investigated by a statistical test called "chi square". This test was used, in this case, to discover whether the responses given by technicians and employers indicated true (or significant) disagreement concerning each item or whether these two different groups may have been in basic agreement and variations in responses may have occurred just by chance. The level of confidence used for these computations (95%) means only that there exists a 95% mathematical probability that technicians and employers agreed in their expressions of inadequacy of preparation or performance concerning the indicated items. It does not mean that their opinions were not important here; it means that there was basic agreement upon inadequacy concerning these items.

Implications of Comparisons of Opinions

The difference of opinion regarding adequacy in English and Speech shown by Table 10 is more extreme than it appears to be. The technicians considered themselves (according to the ratio formula used) to be generally adequate in English and Speech, while employers responses showed that they considered the employed technicians to be generally inadequate. The divergent directions (from the 1.00 null or balance point) of these differing opinions identify English and Speech as important academic areas where a technician was likely to be satisfied with his own abilities while his employer was not. It is also noteworthy that in Technical Writing, where a technician is required to furnish actual demonstration of his skill at communication, the technicians became noticeably less confident and agreed with employers that performance was generally inadequate.

Mathematics is another important area of high relationship to the technician's job (see Table 9) where the 344 responding

$$\text{Ratio of inadequacy for each of the 20 academic areas} = \frac{\text{Number of "barely adequate" responses} + 2 \times (\text{Number of "inadequate" responses})}{\text{Number of "adequate" responses}}$$

technicians expressed a group opinion very close to satisfaction, while their employers expressed a definite opinion of inadequacy.

There is here a suggestion that lack of satisfactory capabilities with Mathematics, English, and Speech may be an important reason, unsuspected by many technicians, for not achieving expected job progress and promotion.

The highest ratio of inadequacy in Table 10 is the ratio for Electronics computed from the responses of mechanical technicians. This high ratio, together with the fact that there was a considerable number of mechanical technicians who also worked in the electrical and electronic fields, implies that practicing mechanical technicians in Vermilion County were becoming involved in electro-mechanical systems. It is quite probable that these mechanical technicians would seek additional training if there were locally available evening classes in the electrical and electronic fields.

Indications of an Exception

There are indications that the responses to the item "Business Training" did not furnish accurate information on the particular academic area with which it is concerned. The most obvious indication of this is that while neither technicians nor employing firms considered this item highly related to the job of a technician (see Table 9), they both agreed (as indicated by the chi square computation) that preparation and performance in this particular area was highly inadequate (see Table 10). Another, and perhaps the most important, reason for doubting the validity of information furnished by responses to this item was that interviewing staff members noticed some difficulty on the part of management personnel as they attempted to respond to this item. Interviewers were several times instructed by management personnel to underline the word "economics" contained in the wording of this item, and it is quite possible that variation in responses was caused by the fact that some respondents were responding to a specific subject matter such as "economics" while others were responding to their conception of "Business Training" as a broad and more inclusive academic area. It is apparent from the rank ordering regarding relationship by both technicians and employing firms (see Table 9) that both considered othere items more highly related to the job of a technician than "Business Training", but it is quite possible that more detailed investigation within this general academic area would reveal some specific subject matter which both employers and technicians might consider highly related to the job of a technician, and in which both would consider preparation or performance highly inadequate.

ANALYSIS OF TECHNICIANS RESPONSES TO UNSTRUCTURED ITEMS ON ACADEMIC AREAS

Technicians' responses to questions concerning other or specific high school courses which they felt would be of value to them mentioned most frequently (in descending order of frequency) mathematics, communication skills, science, and electricity and electronics. Comments in the responses concerning these courses contained the repeated implication that high school physics was not extensive enough for the technicians' needs. Also contained in these comments were suggestions that high schools offer optional advanced courses in electricity and electronics. In response to items concerning valuable courses in other schools which technicians had attended, the unstructured responses became more specific and varied, but mentioned (in descending order of frequency) electricity and electronics, courses from the general area of business training, mathematics, and courses from the general area of industrial relations.

A total of 134 of the responding technicians indicated intentions to take additional courses in the near future. The most frequently mentioned subjects were (again arranged in descending order of frequency) mathematics, electricty and electronics, various engineering curricula, courses in the general area of management training, and courses in communication skills. The most frequently mentioned schools at which these technicians hoped to acquire this additional training were (again in descending order of frequency) Danville Junior College, correspondence schools, and the University of Illinois.

The responding technicians who did intend to take additional work stated most frequently as their purpose for this additional work their intent to prepare for a better job and to increase competency in their present field of work. Among technicians who did not intend to acquire additional training in the near future, the major reasons why they did not so intend were: lack of time, financial reasons, and the fact that courses which they wished to take were not locally available.

Chapter 8

EMPLOYMENT TRENDS

The last page of the company interview form was principally concerned with information relating to employment trends of the 80 companies who were contacted during the execution of this study. In filling out the chart on the last page of this interview form (see Appendix I), interviewers gathered information on the history, present status, and projected trends for each firm. There were two purposes for gathering the historical information: the first was to encourage the interviewed employers to consider carefully their estimates of projected trends as compared with past history; the second was to allow interviewers to judge whether projected trends were realistic in view of past history. The design of this chart was intended to discourage excessive optimism in the employing firms estimates of future production and employment.

Figure VII is a graphical presentation of the total responses given by the 80 interviewed firms. It should be emphasized here that this information is not general information concerning all of Vermilion County; this information (and the trends shown thereby) concerns only the 80 firms in Vermilion County which were employing technicians at the time this study was made. Of the 80 firms interviewed, seven had come into existence between 1961 and 1963, and the influence of the consequent increase in total employment and production is evident in Figure VII. No estimated figures for the year 1970 were gathered during this study; the 1970 projections are simple graphical projections accomplished by straight line extension of the trends between 1965 and 1968.

Figure VII does not show the total dollar volume of production by these 80 companies. Interviewers encountered companies which refused to give actual dollar value of production, but which were willing to give percentages of increase or decrease based upon present production or similar forms of information from which trends could be computed. All dollar values which were given by other companies were converted, therefore, into the same terms, and final result is that Figure VII shows the rate of change in total dollar volume of production by these 80 companies, but not the total amount in dollars.

It is evident that these 80 employers intended to increase

Figure VII

their production and their employment in all classifications shown, and it is also evident that the projected rate of increase in employment in greater for technicians than for any of the other classifications shown. The employing firms obviously intended to increase their production at a higher rate than they intended to increase the size of their work force. Figure VII shows two sets of essentially similar trends: one set is the trends in employment of total employees and engineers employed; the other set is production dollar volume and the technicians employed. Figure VII suggests that these 80 employers sought more efficient production from their total working force, and that one way in which they expected to achieve this increase in efficiency was by increasing the proportion of technicians within their total working force. The totals from which this Figure was constructed indicated the intent of these 80 firms to hire 96 engineers, 268 technicians, and 1144 other workers during the period between 1963 and 1968.

Beyond the demand indicated by the data collected during this study, there existed additional demands for technicians in Vermilion County. The demand for technicians stated above was identified by data collected only from the 80 firms in

Vermilion County which already employed technicians. During the identification of these 80 employers of technicians, a total of 182 other possible employers of technicians were also contacted either by telephone or by personal visit. A noticeable number of these 182 companies informed staff members that they did not employ technicians because technicians were not available. No record was made of the frequency of such responses, and the number of job opportunities which existed for technicians among these 182 firms is consequently impossible to estimate, but this type of response occured frequently enough to assure staff members that there were additional demands for technicians among these 182 firms.

Chapter 9

CONCLUSIONS

Vermilion County firms employing technicians expressed definite interests in technical education. These firms were interested in both a local supply of trained technicians and an opportunity for increased educational qualifications of the employed technicians. The reactions of these employing firms to the lack of technical education within Vermilion County were two courses of action: the majority of these firms were operating some sort of training program for employed technicians, and they were also hiring and bringing into Vermilion County technicians who had gained their training elsewhere.

In conversations with technicians during the execution of this study, interviewers gained the impression that many of the more highly qualified (and therefore more highly paid) technicians were not natives of Vermilion County. This was logical enough, since there had been no local opportunity for technical education, but in order to investigate this impression factually, a computer was programmed to divide the responding technicians into groups according to the location of the high schools they had attended and to compute the mean (arithmetic average) annual salary of each group. *The computer verified the interviewers impression: the mean salary of technicians who had attended high schools outside Vermilion County was $907 higher than the mean salary of those who had attended high schools within this County.*

Considered as a group, the technicians who were working in Vermilion County occupied an above-average economic position. Their salaries (as judged by median values) were higher than generally prevailing rates within this County; their turnover rate was much lower than the turnover rate of the total working force within the employing firms; and their job changes during the past five years were usually accompanied by increases in salaries.

Ages above forty tended to limit occupational opportunities of technicians in Vermilion County, but did not totally eliminate such opportunities. Competency seemed to be the major consideration in the hiring of technicians by the employing firms, with limitations of age at initial hiring being of relatively minor importance.

The employing firms expressed definite preferences, and in many cases definite requirements, that technicians whom they consider hiring have post-high school education. These firms definitely did not wish to hire high school graduates and train them to be technicians, particularly in the case of the engineering technician. Many firms had no choice in this matter, however, because of a lack of qualified applicants.

Educational requirements were not so stringent for industrial technicians and technical specialists, but in all classifications employers displayed a definite tendency to consider post-high school training a prerequisite for employment as a technician.

The 80 firms interviewed in Vermilion County intended to follow a national trend[17] in altering their employment structure during the period between 1963 and 1968. The projected alteration consisted principally of a decrease in hiring rate of total employees and the maintenance of a fairly uniform increase in hiring rate for engineers and technicians. In general, it was the intention of the employing firms to increase the proportion of the professional and technical group within their total work force in order to achieve higher efficiency in production. They intended to maintain an approximate employment rate of three technicians to every engineer within this professional and technical group, with the result that the highest intended rate of increase in employment was for technicians.

The most frequently encountered fields of technology within Vermilion County were, in order of their size, mechanical, electrical and electronic, and chemical. The interviewed employers expressed needs for technicians in each of these fields, indicating that between 1963 and 1968 they intended to hire a total of 268 technicians, most of whom would be hired in the major fields of technology in Vermilion County. It should be emphasized that this figure of 268 technicians is an expression of needs stated by only the 80 firms which were employing technicians. Additional needs for technicians were also expressed by firms which did not employ technicians at the time this study was made. There exists small doubt, therefore, that the five years following 1963 will see more than 268 technicians hired by all industries within Vermilion County. Estimations of needs based upon data gathered during this study and upon projected trends of increase (see Appendix V) are as follows: at least 170 mechanical technicians, at least 81 electrical and electronic technicians, and at least 50 chemical technicians will be needed during this five-year period. In addition there should be a sharp increase in the number of technicians employed in the data processing field by these firms, many of which were investigating the use of data

processing techniques during the time this study was made. To meet these demands (and these are conservative demands, and only by firms within Vermilion County) it would be necessary for a technical school to have enrollments in various technologies as follows:

Technology	Annual Average Enrollment
Mechanical	100-120
Electrical-Electronic	50-60
Chemical	30-40

(See Appendix V for method of estimation of the above)

The above table does not include data processing because there was no reliable estimate possible of the number of data processing technicians in demand.

Conclusions concerning specific curriculum development best adapted to the needs of industry in Vermilion County and the needs of technicians within such industry have not been fully developed in this report. It was the intent of this study to gather and develop information in a manner which would lend itself to curriculum development, and such information has been previously presented within the body of this report.

One cannot, upon the basis of this report alone, make detailed selections of specific course content, but it is possible to state an obvious major conclusion generally applicable to technical education in Vermilion County: a student of technology should consider (at both high school and post-high school level) only a curriculum oriented toward mathematics, communication skills and the sciences; any curriculum not so oriented is an unwise choice for a prospective technician.

The 1963 total high school enrollment in Vermilion County was 6286. Adding an eighth grade registration of 1800 brings the total of the number of students enrolled for possible graduation during the 1963-1968 period to 8086.[18] It is therefore entirely possible that the labor market in Vermilion County will be subjected to the pressure of between seven and eight thousand job seekers between 1963 and 1968. These job seekers will face an employment market which demands increased levels of training as a prerequisite for initial job placement. There is one obvious solution to this, and it is additional education. Opportunity for technical education should not be limited to high school level, and particularly not in a community where established industries have indicated increasing needs for technicians trained at post-high school level. It is also possible that new

industries would be more attracted by a community with a satisfactory local supply of trained technicians than by a community with an existing short supply of such prospective employees.

The educational system of Vermilion County has already reacted to increasing demands for post-high school education through establishment and operation of Danville Junior College and its Division of Applied Sciences. The structure for technical education already exists, and should be further developed to meet both the needs of industry and the needs of the many people who will be seeking work within this industry in the future.

Danville Junior College could better serve its intended and necessary educational functions for Vermilion County if the recommendations of authorities in the field of technical education and the area concept of the National Defense Education Act were here applied.[19] The inevitably expensive nature of post-high school education (including technical education) places an undue financial burden upon any single school district. Unreasonable financial limitations upon any institution of higher learning often produce less than satisfactory results in the quality of education offered to students within such an institution. In order to perform most satisfactorily, the existing structure of Danville Junior College should be reorganized as a County institution. It is inefficient (in both an educational and a financial sense) to have a multitude of schools, each of which is too small to offer its students maximum possibilties in education. This is true with elementary and secondary schools, and that the citizens of Vermilion County are already aware of this is indicated by their continuing consolidation of school districts within this County.

This is also true in higher education, and it is particularly true where it is necessary to equip an educational institution with the expensive equipment necessary to educate competent technicians. Rather than have Danville Junior College with its existing structure for technical education limited to one school district, it would be better to have this institution organized as a consolidated effort by the citizens of Vermilion County to provide for increasing needs for higher education.

SUBJECT: Technician Need Study

The Vermilion County Industrial Survey is organized as a cooperative effort between industry and our public schools. The General Engineering Department of the University of Illinois has joined with the Division of Applied Sciences at Danville Junior College to determine technician needs in Vermilion County. The results of this study will be used as an aid to future curriculum development at Danville Junior College and in other industrial communities in Illinois.

We are asking you to join with us in this industrial survey by completing the attached questionnaire which has been developed by our research group. Your cooperation in reporting sincere and accurate answers will determine the success or failure of this project. Your company has endorsed our contact with you and has given us special permission to solicit this information from you without prejudice. This study is completely impartial to employer-employee relations within your company.

The information given by you is strictly confidential and will be handled as research data available only for analysis by our research staff. You are to mail the questionnaire directly to the University of Illinois upon completion; the form will remain there until destroyed. We want your name only for the purpose of any follow-up work deemed necessary. For instance, if any question should arise in the interpretation of your responses, we would want to be able to contact you personally.

Your cooperation is most urgently solicited and sincerely appreciated. May we take this opportunity to thank you for your time used in fulfilling our request.

Yours for a better tomorrow in Vermilion County industries.

Instructions for Questionnaire

Page one:

We suggest you read the entire list of items on this page before marking each item. There should be a response to each item on this page when completed.

Page two and three:

Please notice we ask for the total number of students (grades 9 through 12) in the High School you attended.

Please fill in blanks which apply to you.

Page four:

We suggest you read the entire list at the top of this page and consider each item in relation to your present job before marking in the columns. There should be a response to each item in this list when this page is completed.

Please check this questionnaire to be sure it is complete before mailing.

NAME_____ ADDRESS_____ PHONE_____

FIRM NAME AND ADDRESS_____ JOB TITLE_____

Major Field of Job: (underline or write in) Mechanical, Electrical, Electronic, Chemical, other (write in)_____

The following blanks to be checked are meant to define the normal course of your work over a period of time. We seek information not just on your work this week, or next, but rather on the work you regularly have done and expect to do in your present capacity with this firm.

Please mark these blanks as follows:

____0 for things you do not do

____X for things you do only occasionally

____XX for things which you do more regularly, but which do not take much time, or which are a minor part of your work

____XXX for things which take up major portions of your time, or which are a major part of your work

____XXXX for things which take all, or almost all your time, or things at which you are normally a full time specialist

____1. Selling firm products or services
____2. Purchasing for firm
____3. Estimating costs for customers
____4. Advising or Consulting with customers
____5. Promotion, Publicity, or Advertising
____6. Writing letters
____7. Technical writing, or writing technical reports
____8. Training new personnel
____9. Training regular personnel
____10. Supervising others
____11. Speaking before groups
____12. Using engineering standards, handbooks, or technical digests
____13. Practical or application testing of theory developed by an engineer or scientist
____14. Policy making, planning, or decision making at management level
____15. Handling money for firm
____16. Keeping office records or accounts
____17. Filing
____18. Using calculating device (such as slide rule, or desk calculator)
____19. Developing or furnishing information upon which engineering decisions are based
____20. Supervising production
____21. Original designing of any kind
____22. Testing experimental products, or recently developed products, or prototype models of products for future manufacture
____23. Programming computer equipment
____24. Using supporting instrument for computer (such as key punch)
____25. Planning installation of production equipment used by firm
____26. Planning installation of firm products
____27. Estimating or computing production costs
____28. Modifying design of firm products
____29. Modifying processes used by firm
____30. Assisting with engineering
____31. Assisting with production
____32. Assisting with new product development
____33. Designing tools, jigs, or other production devices used by this firm
____34. Servicing or maintenance of production machinery
____35. Conducting research
____36. Applying mathematics to design
____37. Sketching
____38. Drafting
____39. Testing products before sale

Re: Vermilion County Industrial Survey

Your name has been furnished as an information source concerning the Technician Need Study our research staff is conducting in Vermilion County.

We need your help. Enclosed is a questionnaire which we hope you will complete and return to us.

It is important that we be able to include your information and your opinions in this study. Please notice we are gathering information not from formal job descriptions or classifications, or from people whose information is second-hand, but from people who actually do certain kinds of work in industry, and who should therefore know more about it than anyone else. This is the reason that your response is so important.

It is our purpose to report complete and accurate information which will be valuable to you, to your community, to your industry, and to the ever-increasing number of young people now coming through your schools.

May we have your cooperation?

Yours truly,

C. A. Murphy
Project Director

APPENDIX V

METHOD OF ESTIMATION OF VERMILION COUNTY NEEDS FOR TECHNICIANS AND TECHNICAL SCHOOL ENROLLMENTS NECESSARY TO MEET THESE NEEDS

Stated demands for technicians by 80 Vermilion County firms during the 5 years from 1963 to 1968: 268 technicians

PROJECTION OF NEEDS FOR TECHNICIANS

Using Vermilion County Trend: Most recent (1962-1963) rate of increase in number of manufacturers in Vermilion County: 5.1%

1964 268 x 105% = 281.4
1965 281.4 x 105% = 295.47
1966 295.47 x 105% = 310.24
1967 310.24 x 105% = 325.75
1968 325.75 x 105% = (342.04)

Using National Trends (Projected by the U.S. Department of Labor): 43% increase in the Professional and Technical Group during the decade 1960 to 1970

$$43\% \times \frac{5 \text{ yrs } (1963\text{-}68)}{10 \text{ yrs } (1960\text{-}70)} = 21.5\% \text{ increase } (1963\text{-}68)$$

$$268 \times 121.5\% = (325.62)$$

Average from Vermilion County Trend and National Trends

$$\frac{(342) + (325)}{2} = \frac{667}{2} = 333$$

THUS: Approximately 333 technicians needed during the 5 years from 1963 to 1968

Distribution of the needed technicians by major technologies based on technician distribution by technologies given by employing firms (see Table 1)

Mechanical Technicians: $333 \times \frac{261}{512} = 170$

Electrical-Electronic Technicians: $333 \times \frac{125}{512} = 81$

Chemical Technicians: $333 \times \frac{77}{512} = 50$

APPENDIX V

TECHNICAL SCHOOL ENROLLMENTS NECESSARY TO MEET VERMILION COUNTY NEEDS FOR TECHNICIANS

Assuming:

1/5 of the graduate technicians needed each of the 5 years 1963 to 1968

1/3 = the ratio of graduates to enrollment (this is a maximum - and seldom achieved - ratio)

		Stated in text as:
Mechanical	$170 \times \frac{1}{5} \times \frac{3}{1} = 102$	(100-120)
Electrical-Electronic	$81 \times \frac{1}{5} \times \frac{3}{1} = 49$	(50-60)
Chemical	$50 \times \frac{1}{5} \times \frac{3}{1} = 30$	(30-40)

The estimates above do not include additional demands for technicians which would be made by:

(1) Above-average industrial expansion in Vermilion County

(2) Vermilion County industries which did not employ technicians because technicians were not available

(3) Industries outside Vermilion County

Ohio,

The information and experience in organizing and supervising vocational programs throughout the state and information from private, state, and federal agencies was used in developing this tentative master plan for joint vocational schools. The state was divided into 57 joint vocational school districts. For each district, figures are shown for building costs, gross operating costs, state operating costs, and net operating costs. Each service of the Division of Vocational Education was asked to prepare a program in its area for each of eight typical joint vocational school programs. The recommendations were to include pupil enrollment, shop and laboratory areas, and equipment costs and related classrooms. From this information, the vocational programs and facilities of eight composite schools were constructed. The building cost was calculated at $16 per square foot. Additional allowances were made at approximately $2,500 per acre for cities varying from 20 to 80 acres, architectural fees at six percent, and contingencies at five percent because of the great variance which could occur among localities in the state. Gross operating cost was calculated at $10,000 per unit. State cost as specified was calculated at $5,230 per vocational unit (salary allowance plus 12 percent), plus administrative and supervisory reimbursement. (SL)

PREFACE

As a result of the impact caused by the last world war, which drew heavily upon vocational education, labor, business and industry and the government to organize and to supervise the work production training program in the consequent emergency, the later impact of unemployment and the poverty problem, but yet the thousands of positions left vacant because of unqualified, skilled and technically trained personnel, considerable interest has been generated in vocational education in Ohio.

As a result of the interest, many smaller forward looking school systems organized vocational programs and have found it difficult to operate the program with a satisfactory breadth of offering. Now, not until the passage of the joint vocational school district legislation in Ohio has the climate been conducive to the consolidation of small school districts into the vocational school district with a sufficient enrollment to provide a program with satisfactory breadth of offerings.

This legislation has further increased this interest and to date, seventeen such districts have been organized. More are in the making. It therefore seemed wise at this time, for the Division of Vocational Education, to prepare a tentative master plan of joint vocational school districts for Ohio which would serve as guidelines in the development and formation of the districts.

The Division of Vocational Education, Ohio State Department of Education, during its many years of experience in helping communities, has accumulated a storehouse of valuable information which they share with local school systems to assist them in making all types of decisions pertaining to Vocational Education. It also has available information on demographic, economic, and employment aspects, and relationship to adjacent areas pertaining to communities from such private, State and Federal agencies as: Sales Management; United States Chamber of Commerce, Ohio Education Association Research Council; Ohio State University Research and Research Foundation; Department of Education, Department of Public Welfare, Department of Health, Division of Vital Statistics, Bureau of Unemployment Compensation, Manpower Development Section Bureau of Unemployment Compensation, and Office of Opportunity, State of Ohio; and Bureau of Employment Security, United States Department of Labor.

In recent years the Division of Vocational Education has assisted many local, exempted villages, cities, counties and multi-county communities in conducting vocational studies. The studies have included student interest inventories, studies of existing school plants and equipment, and summarizations of expressed opinions of interested school and lay personnel through group meetings, correspondence and questionnaires. From the studies, the Division has recommended high school, technical and adult programs, enrollments, physical facilities and costs, equipment costs, number of teachers and similar facts.

To prepare this tentative Master Plan of Joint Vocational Schools for the State of Ohio, the Division of Vocational Education has brought into focus all information and experience in organizing and supervising vocational programs throughout the state and information from private, State and Federal agencies.

Members of the staff of the Division of Vocational Education wish to express their appreciation to the many boards of education in Ohio and their leaders who have so genuinely cooperated in the past through discussion and planning meetings that have built up the great storehouse of information in the state and to those private, State and Federal agencies upon whom the Division has leaned for information.

CHAPTER I

SUMMARY OF COSTS AND PUPIL ENROLLMENTS FOR A MASTER PLAN OF JOINT VOCATIONAL SCHOOLS IN OHIO

This chapter is the end result of work performed in other chapters. It may be read alone as a summary or it may be read after the other chapters have been studied.

Each of the per pupil costs for (1) building, (2) gross operating, (3) State operating and (4) net operating for a joint vocational school, for each of the 57 schools was calculated in Chapter IV. Now, from each of these four per pupil costs and the enrollment for each of the 57 joint vocational schools, the total cost for each of the area vocational schools was calculated. They are presented in table one with the total for the State.

Table 1—Cost Factors for Proposed Ohio Joint Vocational Schools

J.V.S. No.	Total Building and Equipment	50% Building and Equipment #	Operating			Pupil Population
			Gross	State Reimbursement	J.V.S. Net	
Total	$174,242,231	$87,121,115	$30,833,051	$13,281,247	$17,551,804	63,717

Obtained by multiplication.

@ School would probably serve the community better if divided into three or four schools. Allotment has been provided on that basis.

* Schools are probably too small to operate most effectively. They should join another district of their choice. Allotments have been provided on that basis.

CHAPTER II

EIGHT TYPICAL JOINT VOCATIONAL SCHOOLS FOR GUIDELINES

Having decided to use the technique of a series of typical joint vocational schools as guidelines for designing a Master Plan for Joint Vocational Schools in Ohio, each service of the Division of Vocational Education was requested to prepare a program, taking into consideration findings of private, State and Federal labor studies on supply, demand, and related facts, for each of the eight schools in the services. Their recommendations were to include pupil enrollments, shop and laboratory areas, equipment costs and related classrooms.

With the components for each school from the five vocational services, the vocational programs and facilities of eight composite schools were constructed. These are presented in tables 2, 4, 6, 8, 10, 12, 14 and 16.

To the vocational facilities of each school adjustments were made for miscellaneous areas and areas were added for lunchroom and kitchen and library at approximately fifty per cent of a regular high school. The building cost was then calculated at $16 per square foot. Additional allowance was made at approximately $2,500 per acre for sights varying from twenty to eighty acres, architectural fees at six per cent and contingencies at five per cent because of the great varience which could occur among localities in the State.

Gross operating cost was calculated at $10,000 per unit. Vocational administrative and supervisory cost accordingly to the size of the school was included.

State cost as specified in vocational units of foundation reimbursement was calculated at $5,230 per vocational unit (salary allowance plus twelve per cent) plus administrative and supervisory reimbursement.

The net operating cost for the Joint Vocational School District was obtained by subtracting the State reimbursement from the gross operating cost.

The gross operating, State operating and net operating costs are presented in tables 3, 5, 7, 9, 11, 13, 15 and 17.
